NORTH CAROLINA

AGRICULTURAL STATISTICS

North Carolina State Library
Raleigh

1944 ANNUAL ISSUE

FOREWORD

The year 1945 marks the beginning of a new day for the agricultural statistics services for North Carolina. It became convincingly evident early this year that all agricultural agencies are not only interested in the information provided by this division, but they keenly desire more detailed farm facts. Improvements in county livestock, commercial truck, and fruit crop information are especially needed and are eagerly sought.

The county farm census cooperative activity promises to be on a stronger footing than ever

before—in view of the recent legislation approved by county officials and agricultural leaders. This is important, since no other source for obtaining county data is available, and since county agricultural program guidance is so greatly dependent on this information for equitable and practical planning.

Sincerely,

W. KERR SCOTT,
Commissioner of Agriculture.

DATA FOR YEARS 1942-1943-1944

NUMBER 86

NORTH CAROLINA—YESTERDAY AND TOMORROW

COMMENTS FROM U. S. DEPARTMENT OF AGRICULTURE

"Few services rendered by the United States Government affect as many persons directly or indirectly as does the crop and livestock reporting service.

"Banking institutions study the government estimates of crop acreages and crop prospects and of livestock numbers and production as a guide to the demand for funds that they may be called upon to advance for financing farmers through the producing and the marketing season. Railroads use the crop reports as a guide in allocating the supply of freight cars. Manufacturers, merchants, dealers, and business men use crop reports in planning their operations so that the machinery, farm equipment, and supplies will be available to farmers when and where needed.

"Prospective settlers frequently make use of the governmental agricultural statistics to enable them to locate to best advantage in areas best suited to the type of farming they wish to follow."

YESTERDAY

North Carolina realized many years ago that agriculture was her chief industry and source of income. With definite programs for "Better Education," "Good Roads," and "Improved Agriculture," much progress has been made. For several years prior to 1919, the United States Department of Agriculture maintained a statistical office in Raleigh to collect and distribute farm information to those desiring it. The need for a larger and more wide-spread clearing-house service resulted in a cooperative agreement being entered into between the U. S. and N. C. Departments of Agriculture in June 1919.

The resulting Crop Reporting Service represents results of years of work in compiling and maintaining records of all important farm activities. Thousands of intelligent and interested, voluntary reporters contribute current and seasonal information. Several hundred separate reports are collected, developed, and issued yearly providing information pertaining to the various crops, livestock, lands, wages, labor, dairy and poultry products, etc. Acreage and livestock reports are made semi-annually through the cooperation of the Post Office Department with Rural Mail Carriers. Many other organizations contribute valuable information which is summarized and the results published in the interest of improved agriculture.

COUNTY STATISTICS AND BENEFITS

North Carolina was one of the first States to develop county estimates and throughout the years this work has been of great benefit to North Carolina and her people. The work of first collecting county acreage figures was done as a "war preparedness survey" prior to our entrance into World War I. In 1918 this infor-

mation was secured on a voluntary basis, with eighty-two counties responding. The worthiness of this type of information resulted in the State Farm Census Law. This work has been carried on since 1918 with ever increasing interest and benefit until today it is recognized nation-wide as the most reliable basis for determining county estimates.

In 1930 when the drought relief work was provided for the affected counties throughout the Nation, North Carolina was not considered sufficiently damaged to receive Federal aid. However, it was found from acreage figures, based upon the Farm Census Survey taken in the spring for a series of years, and from the yields reported in the fall, that damage had been serious in this State. From this official and recognized county data, thousands of dollars were allocated to individual farmers in the affected counties. This was repeated in 1931.

In order to carry out Governor Gardner's plan to "live-at-home—diversify," basic facts were needed to aid in planning just what to plant and how much of each crop was essential. Again, county statistics of this Department were used as a guide in planning and the program proved very successful and helped the farmers of North Carolina to recover more quickly from the terrible depression of 1929.

THE FACTS WERE READY

When the Agricultural Adjustment Act was put into effect, North Carolina was able to establish her county allotments on a sound basis in much less time than most States because nineteen years of acreage and livestock surveys warranted confidence in the reports and checks against established government records, proved their reliability.

Agricultural teachers throughout the state are particularly interested in the statistical information contained in the publication "AGRICULTURAL STATISTICS" as it furnishes the best material for class work and use in planning special, as well as profitable projects for their students. The data in tabular form presents, at a glance, a complete picture of a certain commodity for a series of years, in a comprehensive and systematic arrangement of facts.

TOMORROW

The urgent need for reliable, unbiased, and dependable farm statistics is greater in 1945 than ever before, for it will be through the intelligent use of the basic county and state farm information supplied by the United States and North Carolina Cooperative Crop Reporting Service that the post-war plans will be formulated and carried to a swifter and more profitable conclusion. This purpose was fully recognized and agreed to by the ALL AGRICULTURAL Service Agencies Conference held before the 1945 legislative committee.

1944 SEASON

On July 1, the two most prominent features of the North Carolina crop picture were the severe drought which was damaging the growing crops and the excellent yields being harvested of all small grains. For the most part, August was more favorable for the growth and maturity of

summer crops and especially the harvesting of tobacco, even though the rainfall was irregular and in some sections inadequate. An excellent peach crop was harvested and commercial apple growers marketed the largest crop since 1941. Practically all sections of the State felt the scarcity of

farm labor but, as usual, North Carolina farmers overcame this difficulty by the cooperative aid of all members of the farm family and the year 1944 ended quite favorably with almost record crops despite the earlier handicaps of weather extremes, insect damage, and disease.

ACREAGE AND PRODUCTION OF CROPS IN THE UNITED STATES, 1944

CROPLAND HARVESTED

Notwithstanding difficulties which at times seemed insurmountable, crop production in the United States in 1944 about equalled the all-time record set in 1942. Yields per acre averaged higher than in any other year except 1942. The acreage harvested has been larger only from 1929 through 1932. In most of the country, growing conditions were much less favorable than in 1942 and there were fewer skilled men on the farms. Only power equipment and long hours of labor saved the situation.

Considering all crops, the outstanding factors responsible for the high average yields in 1944 appear to be the more than normal rainfall in the Great Plains States where rainfall tends to be the limiting factor; heavier than usual applications of fertilizers in the Southeast where yields depend largely upon fertilizers; cumulative effects from the increased use of lime in the Dairy Belt; increased use of hybrid corn in the Corn Belt; the increase in the number of tractor-equipped farms which enabled farmers to catch up after a late start; and the progressive improvement in the technique of crop production in all States.

NORTH CAROLINA CROPS PRODUCTION AND PRICE 1923-1943

The charts above offer good studies in relationship of production and prices for each of the 12 principal crops grown in North Carolina for the past 20 years. Thus supply and demand are shown so far as North Carolina is concerned. Of course the national production has a heavy influence on the prevailing prices.

In the case of corn, in the upper left hand corner, we find that the price in 1924

was about \$1.30. It declined to 40¢ in 1941 and at the present time the price is averaging about \$1.50 per bushel. At the same time the average production, shown by the dotted line, has steadily increased from about 30,000 bushels to about 50,000 bushels. In the case of cotton, upper center, we find that for the five year period, 1923 to 1927, the production averaged between 900,000 and one million bales;

whereas for the 1937-1940 period, it was about 600,000 bales. In spite of this decreased production of cotton in North Carolina the price declined from 30¢ in 1923 to about 10¢ per pound for the 1937 to 1940 period. Of course, since the World War started, the price has gone up, but not in proportion to tobacco and some other crops.

NORTH CAROLINA FARM PRODUCTION, DISPOSITION AND VALUE OF CROPS

1942

NORTH CAROLINA COMMERCIAL TRUCK CROPS, 1944

The 1944 truck crop growing season got off to a slow start due to continuous and excessive rains during the planting season. Much seed was lost completely and heavier than usual replanting was necessary. After the rains stopped and farmers completed their planting, a period of extremely hot, dry weather set in and lasted until mid-July. Due to the combination of these periods of adverse weather, yields on most spring harvested crops fell below average

and returns per acre were so low that many farmers were hard pressed to meet high production costs.

The acreage of truck crops harvested during the 1944 season was estimated at 85,430, about 10 percent less than the 94,480 acres harvested in 1943 and 10 percent less than the 10-year average of 95,390 harvested acres. The value per acre of sales for 1944 truck crops was computed at \$136 compared with \$184 in 1943 and the 10-

year average of \$85 per acre. The reduction in gross returns per acre was due primarily to below average yields harvested from many crop acreages.

The value of sales of North Carolina's principal commercial truck crops in 1944 was estimated at \$11,577,000. This is about \$6,000,000 less than the \$17,394,000 realized from sales during the 1943 season but well above the 10-year (1933-42) average value of \$8,097,000.

While the value of sales of 1944 commercial truck crops for processing showed an increase for the last year, only three of the fresh market crops showed larger returns than were realized from 1943 fresh market sales.

COMMERCIAL EARLY IRISH POTATOES—1945 INTENTIONS TO PLANT

Mid-January reports from commercial potato producers in eastern North Carolina indicated that growers intend to plant 18 percent less acreage of commercial early Irish potatoes in 1945 that was harvested in 1944. If growers carry out their early January intentions, about 26,000 acres will be planted in 1945 as compared with the 31,900 acres harvested in 1944.

¹ Preliminary.

MODERN DAIRY FARM IN PERSON COUNTY

According to the annual issue of *Outlook*, the 1945 aggregate civilian demand for dairy products is expected to exceed available supplies at prevailing prices even with reduced military and lending purchases. Allowing for a moderate decline in income during 1945, it appears that civilians could consume at present prices approximately the following quantities of dairy products on a per capita basis—about 411 pounds of fluid milk and cream, at least 16 pounds of butter, 7 pounds of all cheese, and probably somewhat over 20 pounds of evaporated and condensed milk. This would mean about the same quantity

of fluid milk and cream as in 1944, but increases in the consumption of manufactured products.

But the quantities of dairy products available to civilians in 1945 probably will not be sufficient to meet all of these requirements. A slight decline in the production of creamery butter may continue, but this would be partly offset by increases in the manufacture of whole milk products, especially dried whole milk and evaporated milk. With a continued strong non-civilian demand, supplies of principal manufactured dairy products, especially butter, probably will still fall short of meeting civilian

needs. But supplies probably will be about sufficient to satisfy the civilian demand for fluid milk and cream.

In view of the record corn crop and a decline of about 13 percent in grain-consuming animals in the nation in 1945 from 1944, feed supplies appear ample for dairy producers. The amount of grain available for grain-consuming animals is estimated to be 1.06 tons per animal unit, slightly below the record in the 1942-43 season. If returns received by dairy farmers remain about the same in 1945 as in 1944 a favorable dairy feed-price ratio compared with a long-time average could be expected.

FARM DAIRY PRODUCTS: QUANTITY SOLD, VALUE OF PRODUCTS CONSUMED IN FARM HOUSE-31 HOLD AND GROSS INCOME—REVISED 1941—PRELIMINARY 1942-1943

¹ Preliminary.

SCENE IN WILKES COUNTY

In addition to its importance as a dairy county, Wilkes leads the State in the number of apple trees. Above is shown a scene in this county with one of the many fine orchards in the distance. Cows of quality graze on the extensive pastures and apples of the best grades are found in Wilkes.

GROWTH OF COMMERCIAL HATCHERIES IN NORTH CAROLINA

For a number of years commercial hatcheries in North Carolina were so few that many baby chicks had to be shipped from other states in order to supply the demand of North Carolina farmers. During this period the demand for baby chicks was rather light, especially broilers. Farmers were reluctant to raise more chickens than were needed in the household because of the amount of capital needed to begin such a project and, too, at that time markets for chickens were not so many in number and not as well distributed over the state.

Gradually, things began to change. Research work in poultry had proven many very important points as new preventatives for diseases were discovered. The cost of chick production and the amount of risk involved was being proven not to be as high as many believed it to be. At the same time more markets were being established and careful breeding, along with careful selection of hatching eggs, insured the farmer of receiving better chicks; therefore, eliminating a high mortality risk.

As all these improvements were coming about, the demand for baby chicks began to increase. Throughout the state farmers were being taught and shown how they could profit from raising chickens com-

mercially on their farms. Feed mill representatives, county agents, vocational teachers, commercial poultrymen, and other agriculture officials were trying to push this all important industry. These men were cooperating one hundred percent with the farmers, offering them newly discovered ideas and advising them toward new and better practices.

It can be readily seen from the table on the right that a very definite increase has come about in the hatchery industry of North Carolina during the past six years. The number of hatcheries has almost doubled since 1938 while the egg capacity has almost trebled. It is also interesting to note that approximately three times as many chicks were hatched during 1943 as compared with the number hatched in 1938.

Since the beginning of World War II, commercial hatcheries have continued to increase; therefore the output of chicks has increased. During 1942 and 1943 farmers were buying more and more chickens and raising them in places where many would have said it was impossible to do so. They were being asked to do this for the war effort as well as increasing their farm income. The fact that many of these chickens were raised in houses unsuitable for good results proves the quality

NORTH CAROLINA COMMERCIAL HATCHERY REPORT, 1938-1943

YEAR	Number Hatcheries	Egg Capacity (000)	Eggs Set (000) Number	Chicks Hatched (000) Number	Number Chicks Hatched % of Eggs Set
1938	130	3,595	18,617	13,084	70.3
1939	-----	-----	20,476	14,619	71.4
1940	-----	-----	23,086	16,313	70.7
1941	-----	-----	32,956	23,186	70.4
1942	-----	-----	42,023	29,500	70.2
1943	217	9,393	65,839	39,180	70.2

of chicks produced by commercial hatcheries in the state.

The output of chicks by commercial hatcheries reached its peak in 1943. Due mainly to heavy production during that year, many hatcherymen increased their incubator capacities. While the outlook for chicks during 1944 was fairly bright, it proved to be slightly less than was anticipated. Despite the small demand for baby chicks during 1944 a number of hatcherymen are expecting a normal or better than normal year for hatchings in 1945; therefore bringing about a still further increase in incubator capacities for the state.

FARM WAGES

Farm income and farm wages are of keen importance both now and in view of post-war reconversion programs. Wages have a direct bearing to selling prices of products. The margin of profit can easily mean margin of loss by labor costs. Most farmers use the family and omit this in reckoning their cost of production, which also includes many other legitimate items such as equivalent land rent, overhead, teamwork, and other invisible items. While farm labor is not limited to hired employment, the information above does. Trends of wages paid by farmers is shown for the last four years by districts. Last year's issue showed the state averages for 21 years, as well as items entering into the cost per acre of producing corn, wheat, oats, and cotton.

LAND VALUES

At the right are maps showing the average of land values as indicated. Of course individual counties vary widely, as do farms in counties, and fields in farms. The causes of variations are many, such as location in relation to highways and markets, fertility, and type of soil, cleared land and improvements, neighborhood standards, etc. As of 1945, tobacco allotments influence the selling price more than any other factor while cotton holds no such influence.

¹—Data were secured from official weather bureau reports for 1943.

²—Information on soil types was supplied by Mr. W. D. Lee, Extension Soil Specialist, N. C. State College.

NORTH CAROLINA

"TO BE RATHER THAN TO SEEM"

North Carolina, "The Balanced State," is bounded on the north by Virginia, on the east by the Atlantic Ocean, on the south by South Carolina and Georgia, and on the west by the state of Tennessee. The length of the State from Murphy to Manteo is about 600 miles long and the widest part is found in the coastal area which is, from north to south, approximately 188 miles. There are about 320 miles of shore-line on the Atlantic Ocean, more than 1,500 miles of inland water routes, and approximately 3,000 square miles of coastal sounds.

The surface of the State ranges in altitude from zero on the coast to over 6,000 feet on the crest of the Blue Ridge Mountains, and throughout this range of altitude the plants found are from spanish moss and palmetto in the southeast to the white pine, hemlock, rhododendron, and fir in the mountain region. The total number of plant species is perhaps over 600 and the number of drug plants is greater than found in any other state.

North Carolina is the 27th State in size with an approximate total land area of 31,450,880 acres of which 18,845,338 acres are devoted to farm land. Among the states in total population she ranks 11th, having 3,571,623 persons with 2,597,448 or 73 percent living in rural areas. North Carolina ranks first in native-born population and also first in the average size of the farm family with 4.9 persons per family. In 1940 there were 278,000 farms in the State and the average number of acres per farm was 67.7 acres.

The climate can best be described as that of the warm temperate zone. The mean annual temperatures of the three principal regions are as follows: Mountain, 55°; Piedmont, 60°; and Coastal, 62°. The yearly average rainfall is about 50 inches, distributed throughout the year, with no excessively dry or wet seasons, normally.

The forests of North Carolina are, and have been for many years, one of the chief sources of revenue. Their products include domestic fuel, timber for construction, pulpwood, furniture, and such by-products as turpentine and its derivatives. Soils and climate are ideal for rapid tree growth and the species range from pines and lowland hardwoods to spruce, fir, and balsam found in the mountains.

North Carolina is noted for her variety of minerals and recent discovery of new localities having several essential minerals, in commercial quantities, has made North Carolina one of the foremost fields for exploit and research by mineralogists, and projects are now under way to develop, as well as re-open, several mines for the production of these essential minerals.

In highway construction and maintenance North Carolina has long been known as the "Good Roads State" and is second to none in the number of miles of the highest type roads over which her many important products may be easily and economically transported to a ready market or shipping terminal. It was the original state to establish centrally controlled and uniformly serviced roads throughout the state.

North Carolina, agriculturally as well as climatically and physically, is divided into three distinct parts—Coastal, Piedmont, and Mountain. Each region is well known for particular reasons and since the soils and climate are so varied, practically all crops and livestock to be found in the countries of the temperate zone may be produced in the Old North State.

In the Coastal region which extends from the Atlantic Ocean to the Piedmont "fall line" and covers practically all of 41 counties, including the well-known Tidewater section, a wide variety of agricultural products is grown. No more fertile soils are found in our whole country than in certain sections in the eastern part of the State. Cotton, tobacco, grains, and hays all grow abundantly and with the large and prolific crops of peanuts, soybeans, corn and sweet-potatoes, no section can produce finer pork at a lower cost per pound than can the farmers in this area.

The Piedmont or Central Hill Country is considered most progressive. Improved farming methods and practices are to be found in every phase of agricultural development in the 34 counties embracing the Piedmont section. This is the best grain and hay producing area which, in part, accounts for the many fine herds of dairy cows and the emphasis laid on the production of livestock and related products. Of course tobacco and cotton are both grown extensively, and legumes, especially lespedeza and cowpeas, are among the main crops raised. The renowned Sand-hill Peach section is located in the southern part of this area where the orchards and dewberry fields are so extensive that in the spring they attract many visitors to view them when they are in bloom.

The entire western section is a rugged, mountainous plateau covering about 6,000 square miles and varies in width from 15 to 50 miles. Only a small portion of the land is in cultivation and since there is such a wide variation in elevation the farm land is more suitable to growing natural grasses, pastures, fruits, and vegetables than to general farming, but in certain sections many other crops are included in the farm program. No cotton is raised but quite a sizeable acreage of burley tobacco is planted. Since grains and grasses both grow well it naturally makes this a good livestock section, and beef and dairy cattle and sheep are raised in large numbers. Apples grow in abundance and are of excellent quality. Grapes, cherries, and berries thrive here. This section is destined to become one of the best commercial vegetable producing parts of the State. There is an abundance of pure, fresh water and the healthful climate and unexcelled scenery attract visitors from all parts of the United States each summer.

The tables to follow give a summary of the principal crops and livestock produced in North Carolina with related data. In the near future, a similar summary will be printed for distribution showing the same type information for each of the one hundred counties in the State. If you are interested in this information and wish a copy of it when published, we would like to have your comments and will be glad to place your name on our list to receive a copy.

FINAL DEVELOPMENT OF CROP ESTIMATES REPORTS

THE CROP REPORTING SERVICE

The formal Cooperative Crop Reporting Service for North Carolina was started twenty-six years ago, before which time this State ranked lowest in agricultural statistical services. With the essential aid of the North Carolina Farm Census for county information, we now rank among the leaders. This publication has resulted in State-wide usage of farm statistics that mean farmer cooperation, familiarity, appreciation, and benefit advantages—the lack of which would be serious under existing war conditions.

DOORS ARE GUARDED BY OFFICIAL POLICE

THE AGRICULTURAL STATISTICIAN

Requirements for the Statistician include being farm-reared, farm-interested, and agriculturally educated. Statistical techniques have resulted from years of practice in mathematical methods. The Statistician must learn from years of practice how to investigate, edit, and analyze reports in order to make predictions from the information used. An appreciation and measure of bias or probable error is required in the interpretation of analyses charts and figures used. While accuracy is not sought, the methods used readily locate judgment errors which are often overlooked in accountancy practices and thus insure good final results, even with widely varying individual reports or samples.

U. S. D. A. CROP REPORTING BOARD

These Statisticians work all day behind guarded, "blinded and leak-proof" offices, using crop report information from all States of the Union. The many steps followed have been developed through eighty years experience until the results yield amazingly good estimates or forecasts. They must show close relation to the final check productions. At the end of the table is Mr. Paul L. Koenig, Chairman and Head Statistician. Three State, or "field" Statisticians are required as members at each meeting of the Board.

OFFICIAL CROP REPORT APPROVAL

The U. S. Secretary of Agriculture is shown signing the Crop Reporting Board's release, that goes each month by wire, radio, and mail to all parts of the world. Members of the Board look on with obvious interest after their day's "locked-up" experiences. The Crop Reporting Board develops and releases hundreds of statistical reports yearly, covering all phases of agriculture. Hundreds of thousands of voluntary farmer reporters supply the foundation facts.
