Doc

NORTH CAROLINA

Sheep provide not only excellent mowing facilities but a source of soil fertility and profit. At one time North Carolina had 560,000 head of sheep as compared with only 39,000 now.

THE STATE COMMISSIONER OF AGRICULTURE IS GRATEFUL

In submitting this working information publication, my first wish is to make honorable mention to the thousands of volunteer crop reporters, located in all of the 100 counties of North Carolina, who have made it possible. More than 30,000 make up about seventy different reporting groups, which provide the information sources for the more than 400 reports developed during a twelve months' period.

Except for these reporters, who serve without financial reward, the agricultural estimates would not be available. If only 50 cents per report were paid them, the total cost to reporters alone would greatly exceed the total

that county, state, and federal agencies now contribute for ALL statistical purposes, including this and other publications. This, then, IS a true economic service. So, we recognize you reporters for your loyalty, patriotic and economic services. To you is due the major recognition and praise.

I wish to express appreciation to all county commissioners and tax listing officials for their contribution in making available to their farmers, the past 29 years' county farm statistics, such as this issue carries. These have been responsible for the best farm program-planning facts evidenced in the South.

(Signed) W. KERR SCOTT, *Commissioner*.

1946 ANNUAL ISSUE

DATA FOR YEARS 1925-1946

NUMBER 89

1946 MONTHLY WEATHER-CROP SUMMARY

JANUARY: The weather during January was unfavorable for most farm operations, as it either rained, snowed or sleeted almost every day, making the ground too wet for plowing and too soggy to operate corn harvesters or get into the fields to gather corn. Preparation for potato planting, which normally begins this month, was delayed. The continued cold necessitated more care and heavier feeding of livestock. Rural roads were practically impassable and many counties discontinued schools during the month. Small grains progressed satisfactorily and were not materially hurt by the bad weather. Fruit trees in the western area showed some splitting as a result of the heavy sleet.

FEBRUARY: Although temperatures were slightly above the average and precipitation somewhat below, it was not until late in the month that the weather opened up throughout most areas, enabling farmers to really begin to finish up corn harvesting and cotton picking left over from the 1945 crop. Cotton gins were operating to finish up the previous year's crop. Land breaking was begun and in localized commercial areas, Irish potato planting was completed.

MARCH: Although abnormally warm, with temperatures ranging 7 or 8 degrees above normal, March was generally favorable for farm work and farmers were busy preparing land and planting early crops. Fruit trees made rapid progress during the month but still face the danger of damage by later freezes. The pruning and spraying of fruit trees and the planting of early commercial truck crops was well under way. Strawberries came through the winter in excellent condition and a good crop is anticipated. Pastures are improving and small grains are beginning to head. Tobacco beds are growing well, but blue mold is prevalent.

APRIL: Weather conditions averaged near normal during April. Temperatures were very high in the Piedmont and interior of the Coastal Plains during the first of the month; however, frosts and freezing weather were experienced in these same localities the last two weeks. There was a wide variation in rainfall during the month, however, crops made favorable progress. Tobacco setting was started and has been completed in the Border Belt. Corn and cotton planting was well under way; in some localities corn was up and had the first cultivation.

MAY: Rains were general and frequent throughout the State this month, and while they retarded field work during several periods, they were beneficial to the growth of many crops. Temperatures were cool and more sunshine was needed for the proper growth and development of corn and cotton. These crops need immediate cultivation as the weeds and grass are making a "head" start due to excessive moisture. Final land preparation progressed satisfactorily toward the end of the month. Some grains were damaged by wind and rain. Grasses, fruits, potatoes, and most truck crops were generally in good condition. Cotton planting was probably three fourths completed.

JUNE: Favorable weather conditions prevailed throughout the State, although crop progress was delayed slightly in the northern Piedmont and Mountain sections by dry weather. There were a good many warm sunny days which aided greatly in cotton growth and the growing tobacco also made some improvement. Harvest was in full swing in the Border Belt and beginning in the Type 12 area. Peach harvest was rather general with the Hileys moving in volume.

JULY: Up until July 1, the rainfall in North Carolina almost reached a record, with temperatures more or less favorable, though a little on the cool side, which is unusual for this time of year. During the first part of July, the rainfall was very variable and ranged from very wet in the eastern areas to dry in the west. Toward the end of the month, rains fell in the dry areas in the west and Piedmont, which aided crops materially. Several crops including tobacco, corn, and cotton have been definitely harmed by too much rain. Cultivation has been retarded and much grass is in evidence.

AUGUST: The season so far has been excellent for the growth and development of most crops. The temperature has been about normal except for some very cool periods in the Spring. There has been ample sunshine and rainfall has been adequate. Scattered showers have helped in the drier regions. The usual storms at this season have not been so severe. Crops conditions are from fair to very good, depending on the moisture needed. Considerable boll weevil infestation was found in the lower Piedmont and lower Coastal counties. Some improvement in the peanut crop was shown in the main produc-

ing areas. Apples are ripening early and being picked in Wilkes County.

SEPTEMBER: September started off with a very dry period during the first part. In most Piedmont and Mountain section, the soil was too dry and hard for fall plowing but in the southeast some progress in fall farm operations was being made. Some mountain streams were at the lowest level in several years. Coastal counties received ample moisture. A good hay crop was harvested as the weather has been just right for this work. Toward the end of the month, heavy rains fell, especially in the Coastal counties, which helped to condition the soil for fall planting.

OCTOBER: Little rain below normal temperatures and light to killing frosts in the Mountains and interior Coastal counties ushered in the fall weather of October. Toward the middle of the month, beneficial rains came and late truck, cover crops, pastures and growing legumes improved. The last two weeks had favorable temperatures, some rainfall, and adequate sunshine, which made ideal outdoor working conditions. The bean crop in the west was damaged by frost. Pecan prospects in the east are rather poor, due to various insect damage, disease and unfavorable climatic conditions.

NOVEMBER: Warm temperatures, adequate rainfall and ample sunshine were the important weather features at the beginning of the month. Toward the middle of November the fall weather really began to set in with moderate days but "too cool" nights. Light frosts were scattered with more serious consequences in the west. The last week was very cold with a deficiency of sunshine.

DECEMBER: December found most crops harvested with above-average crops of corn, Irish potatoes, sweet potatoes, tobacco and hay. Generally speaking, this has been a very good year for crop growth and development. Some crops were slow getting off to a start last spring, but more favorable conditions later overcame this handicap. Good fall weather helped cotton materially and although the crop was not up to earlier expectations, many small bolls matured, which otherwise would have been lost. The peanut crop suffered most from the wet weather but is still better than the previous year. Weather between harvest and picking is very important.

* Includes prairie, marsh and salt grasses.
** Actual acres and grown for fresh market.

ACREAGE AND PRODUCTION OF CROPS 1946

The total output of crops in 1946 was the greatest in the history of our country. High yields are primarily responsible, although the harvested acreage is fairly large, and the growing season was more favorable than usual. The aggregate volume of crops is 26 percent above the 1923-32 (pre-drought) average, 2 points above the previous record production in 1942 and 7 points above that of last year. Not only the quantity but also the quality of crops was outstanding.

Production of individual crops reflects the generally favorable growing conditions. A 3.3-billion bushel corn crop of excellent quality tops any previous crop. For the third successive year more than a billion bushels of wheat were harvested, production this year breaking all previous records. Rice, soybeans and cherries set new marks in the final harvest returns to join potatoes, tobacco, peaches, pears, plums, and truck crops. Crops with near-record production are oats, peanuts, and grapes. Better than average crops of hay, sorghum grain, popcorn, dry

peas, sweetpotatoes, apples, prunes, apricots, hops, sugarcane and sugar beets were harvested. Cotton and cottonseed production, however, is about one-third below average and, with the exception of 1921, the smallest since 1895. Other crops falling below average are barley, flaxseed, buckwheat, rye, broomcorn, dry beans, cowpeas, pecans, and maple products.

Growing conditions throughout the 1946 growing season were mostly favorable. Although winter grains went into the winter in only fair to good condition, they got an excellent start in the spring.

Shown on this page are data pertaining to North Carolina's tobacco crop, broken down by various belts. These figures are the revised estimates of acreage, yield, production, price, and value of production for the years 1929 through 1946.

1946. The 1946 figures are preliminary, although it is expected that very few changes will be necessary in the data. It is interesting to note the tremendous increase in yield per acre for tobacco since 1929. In fact, 1946 yield was almost

ALL CORN: Acreage harvested and Bushels Produced
North Carolina 1866 - 1946

The above chart shows the history of corn acreage and production in North Carolina for the 81 year period 1866-1946. Note that there has been very little change in acreage harvested during this period but that total production of corn shows a decided upward trend and is nearly three times as great now as a half century ago - Due of course to the increase in yield per acre. - From 9.5 bu. in 1866 to 27.0 bus. in 1946.

COMMERCIAL EARLY POTATOES

The above table presents statistics on the North Carolina Commercial Early Irish Potato crop for the years 1940 through 1945. This is the first time that county estimates have been published pertaining only to

the commercial crop grown in Eastern North Carolina. The data should not be confused with the County estimates shown on Page 22 which are the figures on the total Potato crop and includes the commercial crop as shown on this page.

These estimates are based upon data

from all available sources originating mostly at the farm. The acreage figures are obtained from the farmers through the State Farm Census while the yield and price data are reported by growers through mailed inquiries.

IRISH AND SWEET POTATOES

The above chart shows the trend of Irish and Sweet Potato acreage in North Carolina since the Civil War. It is interesting to note that until after the first World War the acreage of Sweet Potatoes was more than twice that of Irish

Potatoes. Since the early twenties, however, with the beginning of the commercial early Potato growing in the eastern part of the State the acreage of Irish Potatoes almost doubled.

The peak of Sweet Potato acreage was reached in 1932 when 101,000 acres were

grown. Since that time the trend has been downward. However, the portion of the crop going into the commercial trade has increased. Irish Potato acreage reached its highest during the recent war when 110,000 acres were grown in 1943.

Statistician's Page

STATISTICIANS' VIEWS

To begin with, the title is hard to pronounce, harder to define, and still harder to clarify to others. We usually say that, "while accountancy is used for interpreting measurable or known information, statistics or *estimates* are in the field of unknowns or unmeasurable features, but concerning which information is needed."

An auditor assembles expenditures, inventories, bills, etc., while the statistician must *estimate* such things as crop forecasts, price trends, *expected* farm plantings, etc. The ultimate purpose of each field of study is to provide information that facilitates planning budgeting and anticipated production or income. Accuracy is the keynote of the accountant, while approximation, rather than absolute accuracy, is the objective of the statistician. One is mostly purely mathematical, while the other also requires sound judgment and familiarity as prime factors.

OUR NEW FARM REPORT

It was last spring (1947) that we were enabled to issue a four-page sheet carrying digests of many important reports developed during the previous four weeks. Outside printing was entirely too expensive, and required too much time for deliveries. As it is now, all the work is done in our own office, quickly and much cheaper than would otherwise be possible. This new service should serve a definite and needful purpose.

PERSONAL MENTION

A handicap of our Crop Reporting Service is the lack of personal contacts with our many loyal reporters. Reasonably, each one visualizes how we look and act. Too, there is the matter of our attitude and appreciation of the reports returned. Of course I have often run across someone who says, "Well, I have pictured you as a small, dried-up and sour guy." Another has quite a different impression. Actually, I am almost six feet tall, weigh 195 pounds, have some "bay-window," gray hair, awkward walk (from infantile paralysis at age two), am generally optimistic, energetic, and like folks above all else. And, oh! yes, I am age 62 and expecting to retire and enjoy my farm and other interests by age 65. Now what do you think?

THE FARM CENSUS CHANGE

For thirty years, I worked for the annual farm-census survey, because I knew, beyond any reasonable doubt, that it was infinitely better for our public welfare than any handicaps to the listing of taxables. This was provable. As a federal official, this "outside" interest was not required of me. The county officials at the 1947 Legislature, however, had it changed to a five-year survey, thus pulling its "teeth," so far as its chief county and yearly information values are concerned. We regret this serious loss to our agricultural leaders and farmers, but experience is sometimes a *necessary* teacher—even if it is costly.

BEHIND THE DESK

Did you ever know a *successful* farmer who stayed in his house and conducted his outside affairs without visiting his fields, markets, lots, or barns? The same applies to our statisticians who must understand and keep in touch with state-wide, farm-wide and year-round conditions.

Most people think of a statistician as being a theorist, "guesser," desk man, and otherwise unfamiliar with practical farming practices and problems. In fact, farm-reared men with college training in economics and statistics provide our most understanding and interested assistants.

LONG YEARS' SERVICE

By the time this reaches you, I will have been in this same work for 32 years, with 9 years' previous, excellent preparation in this and other States. When I began in 1916, I was boss, clerk, janitor, stenographer and field investigator for the federal agency alone. Thus, I have had the privilege of learning from the bottom. Now, however, there are about thirty of us, and still we have more to do than can be accomplished adequately, due to the tremendous growth in scope and cooperative relations.

Instead of a monotony of figures, there is a constant change of work and thinking. Oftentimes, there are several matters requiring simultaneous attention. Decisions must be made quickly, and familiarity with each matter is essential.

Frank Parker.

This is a harvest scene in the heart of the peanut belt of northeastern Carolina. A statistician was studying the probable yield and quality of the stacked crop.

VALLEY IN WATAUGA COUNTY. GOOD PASTURES ARE THEIR MAIN CROP

Whether in the East or West, North Carolina is a great State. It is still predominantly agricultural.

These two pictures provide good object lessons. The eastern peanut farmers just doesn't see how anyone could make a living in the mountains, where there is scarcely a spot on which one can have straight rows. But, these people *live* better or happier than those in the east, who are so dependent on cash crops.

It is true that the "mountain" winters are colder, the farm paths muddier, and care of livestock more arduous, but during their summers, they have many natural advantages, including fruits, vegetables, spring running water supplies, scenery, flowers, energetic climate and plenty of meat and other real "living" conditions. Our mountain folks are neighborly, co-operative and, otherwise, think and act unselfishly. Too, they can produce cattle cheaper and better than

our eastern farmers.

Of course, our flat eastern land has its advantages too, especially where farm machinery is involved. The mountain farmer, having two acres of tobacco in four patches or "fields," compares with the eastern single field of twenty acres. So, it takes a heap of varied farming and living to make up our good State. *Agricultural Estimates* involve all features, localities and farm-wide conditions.

Hereford heifers on Coastal Plains prove quite profitable
