## FOREWORD

Agricultural statistics are essential if farmers and others are to perform an intelligent job of production and marketing.

This issue of NORTH CAROLINA AGRICULTURAL STATISTICS presents summaries of the most important data assembled by the Crop Reporting Service and the Statistics Division of the State Department of Agriculture.

Part of the original information for AGRICULTURAL STATISTICS comes from thousands of volunteer crop reporters—farmers all over our State. Other information is collected by a smaller group of paid workers appointed by county officials to take the annual State Farm Census. This mass of data is evaluated, adjusted and compiled by a staff of highly trained professional statisticians in Raleigh.

In 1919 the North Carolina Department of Agriculture entered into an agreement with the United States Department of Agriculture to collect agricultural statistics on a cooperative basis. That was the beginning of the North Carolina Crop Reporting Service, upon which thousands of farmers, agricultural workers, business men and others have learned to depend for reliable information on various phases of crop and livestock production in North Carolina.

This agency has expanded and perfected its services to meet a growing demand for basic agricultural data. This information has increased in importance with the development of our modern but complex system of economy. It has proved especially valuable in the formulation of plans and programs which reduce the speculative hazards of farming and balancing supply and demand.

---

*Commissioner of Agriculture*

## DEDICATION

This issue of AGRICULTURAL STATISTICS is dedicated to Frank Parker, who retired from active service as North Carolina Federal-State Statistician on April 30, 1953. For 37 years his efforts were devoted untiringly to the development of a Crop Reporting System for the Tar Heel State second to none in this country. He leaves with his many friends throughout North Carolina an outstanding example of achievement in his field of endeavor.

He is truly a *Tar Heel!*

### Front Cover

Areas of the State shown on the front cover are comparable with a combination of two or three Crop Reporting Districts. The Mountain Area comprises Districts 1 and 4; the Piedmont Area comprises Districts 2, 5 and 8; and the Coastal Area comprises Districts 3, 6 and 9. All tables in this publication showing data by counties are summarized by Crop Reporting Districts.

The rural population in the Piedmont and the Coastal Area is approximately the same; however, 70.3 percent of the State's manufacturing employees are in the Piedmont compared with 14.1 percent in the Coastal Area. The Mountain Area has 15.6 percent of

the total manufacturing employees. Counties comprising the Coastal Area accounted for 65.7 percent of the total value of 11 principal crops in 1951. This compares with 27.8 percent in the Piedmont Area and 6.5 percent in the Mountain Area. The percent of the total of all cattle on farms by areas is as follows: Mountain 31.6; Piedmont 44.2; and Coastal 24.2.

Dates to which the items listed on the Front Cover relate to are as follows: Rural Population, April 1950; Manufacturing Employees, March 1950; Value 11 Principal Crops, 1951; and All Cattle on Farms, January 1, 1953.

# INTRODUCTION

NORTH CAROLINA AGRICULTURAL STATISTICS brings together the more important series of current and historical statistics concerning agriculture in the State. An effort has been made to publish information most often requested by farmers, the general public, and workers in other Government agencies. Our semi-monthly release entitled "Farm Report" and various other periodic releases are published to meet the needs of persons requiring information on a weekly, monthly or seasonal basis.

## Revisions

Every five years, regular estimates made by the Crop Reporting Service are reviewed in light of the results of U. S. Census of Agriculture. The U. S. Census of Agriculture has always served as a "benchmark" for crop and livestock estimates. This is our first annual publication since the receipt of results from the 1950 U. S. Census of Agriculture. Revisions of previously published estimates for 1945 through 1949 have been included in the appropriate series of data in this publication. North Carolina conducts an Annual Farm Census on acreages of principal crops and the availability of these data minimizes the revisions in previous estimates of acreages of major crops. A review of previous estimates is also made once each year and revisions are made on the basis of results from the Annual Farm Census and any other check data.

## County Estimates

Acreages by Counties for each of the eleven principal crops shown on pages 13 through 32 and on page 64 are based on the annual North Carolina Farm Census.

## 90th Anniversary

The collection and dissemination of agricultural statistics is the oldest activity of the United States Department of Agriculture, having had its start in 1863 during the Civil War. Hence, May 1953 marked the 90th anniversary of the first crop report prepared by the U. S. Department of Agriculture.

## List of Reports

The North Carolina State-Federal Crop Reporting Service publishes official estimates of crop and livestock production, prices paid and received by farmers, and various other special reports. A list of the more important reports and the approximate date of release is shown in the table below. These reports may be secured by writing to Agricultural Statistician, Box 2779, Raleigh, N. C.

| Name of Report                         | Frequency of Report | Approximate Date Available in Raleigh |
|----------------------------------------|---------------------|---------------------------------------|
| <b>I. CROP REPORTS</b>                 |                     |                                       |
| 1. Intentions to plant                 | Annual              | March 20                              |

## Foreign Trainee Program

Foreign visitors to the United States have been numerous in recent years. The Mutual Security and Point Four Programs have made it possible for capable people from many lands to come to this country as students and observers. North Carolina, with its outstanding educational facilities has attracted its full share of these visitors and the Tar Heel State is now known by individuals from many parts of the world.

Students and employees of participating governments who are interested in Agricultural Statistics usually have the opportunity to spend from two weeks to six months or even longer in Raleigh. The facilities to be found at the Statistical Laboratory of N. C. State College and here at the State-Federal Crop Reporting Service are prime factors in the decision to send these students to North Carolina.

Since the close of World War II, some 52 statistical students from 24 countries have been assigned to this office for training and observations. This program was stepped up considerably during 1951-52 and a formal program of training was instituted at N. C. State College and at the State Agricultural Statistician's office. Here they are taught the theory and practical aspects of statistics. Their training is not all classroom work, as considerable field travel is arranged so that they have the opportunity to become acquainted with North Carolina farms and with the state in general. At the statistician's office much time is devoted to the study of the practical applications of statistics in the field of crop and livestock estimating. They observe the methods of estimating as practiced by the North Carolina Crop Reporting Service.

## Introducing: Henry L. Rasor

Henry L. Rasor, who served as State Agricultural Statistician-in-charge of the Louisiana office of the Federal Crop Reporting Service from October 1951 to June 1953, succeeded Mr. Frank Parker as Statistician-in-charge of the North Carolina office on June 8, 1953.

Mr. Rasor, a native of South Carolina, has had extensive training and experience in a succession of responsible assignments in the Federal crop reporting work over the past 26 years. After his first 3 years in the South Carolina office, he was assigned to Arkansas in 1930 and to Texas in 1935. In 1940, he transferred to the Washington, D. C. office where he was directly responsible for work on the cotton estimates for the Crop Reporting Board. From September 1945 until he took charge in Louisiana, he served as the statistician next in charge in the Austin, Texas, office.

# NORTH CAROLINA AGRICULTURE A BILLION DOLLAR INDUSTRY

## Record Gross Farm Income in 1951

Total gross income on North Carolina farms amounted to more than one billion dollars both in 1952 and 1951. The all-time record \$1,106,224,000 gross income for 1951 is followed closely by \$1,087,375,000 in 1952. In no other year prior to 1951 has the value of the State's agricultural output reached the one billion dollar level. The previous record was in 1950 when total gross farm income was calculated at \$955,715,000.

Cash income received for all agricultural commodities sold in 1952 totaled \$942,169,000 -- just slightly below receipts of \$954,080,000 in 1951. In addition to income from sales of agricultural commodities, farmers received Government payments for Soil Conservation practices to the sum of \$6,790,000 in 1952, and \$8,032,000 in 1951. Also, the value of farm products consumed on farms where produced is estimated at \$138,416,000 in 1952 and \$144,112,000 in 1951.

Due to increased unit prices and to increased production, value of cash sales from each of the livestock and livestock products items established new highs in 1951 and/or 1952. Income from tobacco in 1951 was by far the highest of record, while dollar sales of soybeans and peanuts were also at all-time highs. Sales of cotton and apples in 1952 reached record levels, while near records were established for several other crops.

## State Ranks High in Cash Farm Income

North Carolina ranked fourth among the States of the Nation in receipts from farm marketing of crops in 1952. Only California, Texas and Illinois had larger cash receipts from sales of crops than did North Carolina. Due to the relative unimportance of livestock production in the State, she dropped to thirteenth position in receipts from sales of all farm commodities. Production of livestock is becoming more and more important, however, and the proportion of the total cash income coming from these items continues to increase. Livestock and livestock products accounted for 21.8 percent of receipts from all commodities in 1952, compared with 20.3 percent in 1951, and 19.6 percent in 1950. Ten years earlier, in 1942, these products accounted for 15.3 percent of total receipts.

As usual, tobacco led all crops in value of sales during 1952, accounting for 48.5 percent of the cash income from all commodities sold. The 1952 cash income from tobacco was equivalent to \$612 for each acre of tobacco harvested that year. The total of \$457,228,000 realized from North Carolina tobacco sales in 1952 is the largest income from any single crop in any one state except for cotton in Texas. Cotton was the second most important North Carolina crop in terms of cash sales. Receipts of this crop in 1952 amounted to \$119,125,000 or 12.6 percent of the receipts from all commodities sold.

## Farm Production Costs Also At High Level

Although gross value of agricultural production has trended sharply upward during recent years, it must be remembered that farmers' costs have also made continued and rapid increase. In terms of purchasing power, therefore, the monetary returns to farmers for their agricultural production are not quite so impressive as would appear on the surface. On the chart at the bottom of this page, the trend in prices received by North Carolina farmers for items they sell is compared with prices paid by U. S. farmers for articles they must buy. It will be noted that for the period 1942 to-date prices received in relationship to prices paid have generally been more favorable to farmers than during the period prior to that date. At the same time, it will be observed that since 1942 prices farmers pay have risen about as fast as those they receive.

## Productive Capacity Trends Sharply Upward

Perhaps the most noteworthy feature of the agricultural output is the trend toward increased quantity production per unit. Per-acre yields of practically all field crops in the State are being increased through improved cultural practices, through use of better varieties, and through use of more highly effective insecticides. The upward trend in tobacco yields has been particularly significant. The average per-acre yield of all types of tobacco during the 5-year period from 1948 to 1952 inclusive, at 1,270 pounds, is 83% above the average of 695 pounds for the 10-year period immediately preceding 1934, which was the first year of tobacco acreage allotments. Per-acre yields of corn in 1952 were sharply reduced by drouthy conditions, but averages for other recent years were approximately 50% above yields normally to be expected prior to the use of hybrid seed and improved fertilizer practices. Extremely severe weevil infestation in 1950 resulted in a per-acre cotton yield for that year below any other year in the current century. Excluding 1950, the average yield of cotton during the 1948 to 1952 period exceeded that for the 10 years immediately preceding 1934 by approximately one-third. Yields of winter grains have shown a sharp upward trend as have yields of soybeans and peanuts.

Through better breeding and improved feeding practices, milk cows have been induced to produce more and more milk. Average annual production per milk cow during the 1948 to 1952 period ran 15% above that for a comparable period twenty years earlier, and the up-trend is likely to continue. Hens and pullets of laying age in 1952 were producing 50% more eggs than they had produced twenty years earlier.

Although much of the benefit to farmers from increased per unit returns per farm production have been offset by increased cost for the items he must buy, he has materially improved his financial position through increased production.

TREND IN INDEX OF PRICES RECEIVED BY NORTH CAROLINA FARMERS FOR ALL COMMODITIES AND PRICES PAID BY U. S. FARMERS FOR ALL COMMODITIES BOUGHT INCLUDING INTEREST, TAXES AND WAGE RATES, 1925-1952

# 1952 MONTHLY WEATHER-CROP SUMMARY

**JANUARY:** January had uncommonly high temperatures, average rainfall, and generally mild weather, more like spring than mid-winter. Temperature records were broken on the first two days, when the mercury reached the low 80's at many places in North Carolina. Average temperatures over the State for the month were five degrees above the normal. The unseasonable warmth, however, was interrupted frequently by moderately cool days, and there was little evidence of premature bud-swelling. The heaviest rainfall occurred in the mountains and the lightest on the coast; in most places it was adequate, but not excessive. There was little snow. In general, weather was favorable to agriculture.

**FEBRUARY:** February was an equable month, slightly above normal in temperatures and rainfall, with the greatest excess of the latter along the coast, making up for the deficiency there in January. A series of offshore storms threatened North Carolina during the month, but only the last, which passed near Hatteras on the 27th, came close enough to cause other than heavy cloudiness and seasonable rains. The last storm brought strong but not destructive winds to the coast, and several inches of snow to the interior. This was the heaviest snow-storm of the winter season. During a large part of February, soils were too wet for farm operations, and outdoor work generally was impeded.

**MARCH:** In accord with tradition, March was rather windy, with some light destruction in local areas. It was also wet, with an average of seven inches of rain over the State. The heaviest rains fell in the Piedmont and parts of the mountains, local monthly totals of from ten to fifteen inches being rather common. There were two occurrences of general snowfall, but amounts were not large and very little remained on the ground after it had stopped falling. The heavy rains brought rivers to flood stage three times, and wet soils delayed land preparation considerably. Temperatures were moderate throughout March, with no unusual extremes of heat or cold, and no temperature records broken.

**APRIL:** April is normally a dry month in North Carolina, and April, 1952, was even drier. There were the usual number of rain periods, but the amounts were generally small during the first three weeks, since the last five days of March had been almost totally without rain, this made a month-long dry spell. Many soils scheduled for April planting became too hard and dry for plowing; hence, some crops got a late start. Pastures, winter grains, and other crops already planted suffered from lack of soil moisture. Some moderately severe local storms occurred during April, but it was too early in the season for much crop damage. April averaged a little on the warm side, and during an unusual spell on 21-23, temperatures reached 90 or higher over most of the State.

**MAY:** Like April, May was a little drier than usual. There were no long rainfree periods for the whole State, but the frequent shower periods were light and spotted. As a result, a few places were very dry, a few had ample rain, but most areas were a little short for the season. There was a great deal of sunshine, but some stormy weather, with local hail damage quite large around the 10th. Most of the crop damage was to tobacco. Some scattered hail was reported on seven other days in May. Temperatures averaged rather high during the month, and 90 degree readings were general during two periods. May was too dry for crops in most areas, but the abundance of warm, sunny weather favored growth where moisture was sufficient.

**JUNE:** June, 1952, was the hottest on record in most of North Carolina, and also one of the driest. The combination made it extremely hard on most crops, especially in view of the dry weather of the previous two months. Ninety degree temperatures occurred every day of June, and 100 degree readings on at least twelve days. There were showers almost daily in some part of North Carolina, but they were very local in extent and usually light. The few occasions of heavy rain were too often accompanied by heavy local hail and wind, causing much destruction of growing crops. The heat and drought damaged not only field crops, but also lawns, gardens and even sensitive trees and shrubbery.

**JULY:** The first half of July had seasonable temperatures; the last half was even hotter than June. One hundred degree temperatures were reported within North Carolina on all of the last 13 days, and 90 degree readings on all 31 days. Eight stations reached 107 degrees on one or more days; nearly all localities outside the mountains, and some within the mountains, reached at least 100. The dry period that began in April continued in July, with the average rainfall deficiency over the State 1.71 inches for the month. Until heavy rains fell at the end of July, the deficiency was three to four inches. Aggravated by the heat, the drought caused considerable crop damage. The sporadic showers that came were often accompanied by local hail and wind.

**AUGUST:** In sharp contrast with the previous four months, August was cloudy and damp, with mild temperatures. Rainfall was nearly double that of July, and more than double that of any other month of the 1952 growing season. A great deal of this rain fell in connection with two tropical storms that crossed the State during the last four days of August. Even without this, however, the month had normal and well distributed rainfall. Neither storm brought any noteworthy destruction to the State, but there was the usual amount of local hail and lightning damage from day to day. The temperature did not reach 100 degrees during August, and the average for the month was near normal for the season.

**SEPTEMBER:** September was a little on the dry side, but not unusually so for the time of year. Three tropical storms affected the month's weather, accounting for nearly all the rainfall, but doing little storm damage. The first storm was leaving the State as September began; the second passed inland to the south on the 11th; the third grazed the North Carolina coast on the 22nd and 23rd. Moderate temperatures prevailed, averaging a fraction below September normals, with no unusual extremes of heat or cold. Weather was generally fair between the rain periods that were stimulated by the three tropical storms, and September had a generous share of good harvest weather.

**OCTOBER:** Weather in October was cool and dry; the driest of any October since 1943, and the coolest since 1917. There was a cloudy, rainy spell from the 7th through the 11th, but amounts of rainfall were not large. Nevertheless, this period, plus a few showers around the 1st and 15th, accounted for the month's total rainfall. No rain at all fell during the last two weeks, making one of the longest totally rainfree periods in North Carolina weather history. At the same time, the humidity of the air was very low, and numerous destructive forest fires broke out. Record-breaking cold weather occurred near the 21st and 30th, with freezing temperatures all the way to the coast. Averages for the month were nearly four degrees below normal.

**NOVEMBER:** This was the third month of 1952 in which rainfall was considerably above long-term averages. The first nine days were dry, continuing the October drought, but rains that fell on the 10th and 11th were sufficient to drown most fires and partially replenish depleted soil moisture. The remainder of the month was mostly cloudy and damp, except for a few fair days about mid-month. Rainfall over the State averaged one and one-half inches above the November normal. Temperatures varied from moderately warm to rather cold; 80 degree readings were rather common around the first of the month, while cold spells around the 8th and 28th brought below-freezing temperatures all way to the coast.

**DECEMBER:** December was an unusually cloudy month, but with most parts of North Carolina getting a little less than normal rainfall. Of the four general rain periods, only the last, at the end of the year, gave average amounts of as much as an inch. Light snow occurred several times in the mountains, and a few flakes reached Hatteras on the 15th. Temperatures went through several ups and downs during the first half of December, but with no unusual extremes, either high or low occurring. The last half of the month was more equable, being a little on the warm side until a cool turn just after Christmas. Slow warming after this brought the mercury to near normal at the end of the year, and averages for the month of December were also near normal.

# THE DROUGHT OF 1949-1952

The drought which has plagued North Carolina agriculture for the past three growing seasons has been the subject of much discussion and study. As is often the case, however, the situation was less serious than it appeared at the time. Many crops in several sections were adversely affected, it is true, but the agriculture of the State, as a whole, maintained a fair level of production.

Aside from the effect on crop growth, one of the principal difficulties suffered was the depletion of municipal and rural water supplies. There was a particularly widespread shortage of water during the summer and fall of 1951; both that season and the previous winter had very low rainfall (See Figs. 3 and 4 on right), and the accumulated shortage was evident in the surface water supply. In some cases, perhaps the situation was aggravated by the fact that growing populations had not been matched by increased facilities for storing and supplying water. In such cases, previous droughts of similar proportions have passed with much less notice.

Two similar periods with less average annual precipitation have occurred within the memory of most of the adult population. The driest 24 consecutive months of the recent drought period were November, 1949-October, 1951, inclusive. The average precipitation over North Carolina during that period was 83.77 inches, some fifteen inches short of the usual two-year amount. In comparison, average precipitation over the State during the calendar years 1930-31, was 81.61 inches, while in 1925-26, the figure was only 80.65 inches. In addition, the more recent period 1940-41, gave a total two-year precipitation of only 84.10 inches. Moreover, the calendar year 1925 was drier than any twelve consecutive months of 1949-52. Thus, in terms of quantity of rainfall, there was nothing unprecedented about the recent drought. Nevertheless, because of its recency, if for no other reason, public interest in the drought of 1949-52 warrants a discussion of its features as they affected North Carolina.

In the following discussion, the term "normal" will be defined as an average taken over the period of record. Just how valid this is may be questioned; indeed, the existence of a "normal" amount of rainfall, or a "normal" temperature, is open to question. The most commonly used normal is the arithmetic mean, or average, such as used here; actually, however, the records from which such a normal is obtained often have more than half the years with somewhat less than average rainfall, and fewer than half the years with considerably more than average. Thus, an arbitrary normal might be chosen which is a greater amount than that which fell in exactly half the years of record and a lesser amount than the remaining half. Such a "normal", called the median by statisticians, would ordinarily be a little smaller than the normal used here, which is obtained simply by adding the total precipitation for the period of record and dividing by the number of years.

Normal annual precipitation in North Carolina ranges from about 38.5 inches in parts of Buncombe County to nearly 83 inches in southern Macon County, both of these areas of extreme being in the southern half of the Mountain Division, and only a little over fifty miles apart. Over the Piedmont and Coastal Plain Divisions, the range of normals is much less, lying generally between 45 and 55 inches per year. Nevertheless, the range of normals from station to station around the State is sufficient to render confusing any discussion of drought based on actual rainfall alone. In the illustrations accompanying this discussion, therefore, the departures from normal are portrayed rather than the actual amounts of precipitation.

Figures 1-5 show the departures over the State by six month periods, the period April through September approximating the growing season, and the period October through March

Figure 1. Precipitation, Departures From The Normal In Inches, October 1949-March 1950. State Average, -3.78 Inches.

Figure 2. -Precipitation, Departures From The Normal In Inches, April-September, 1950. State Average, +0.78 Inch.

Figure 3. -Precipitation, Departures From The Normal In Inches, October 1951-March 1952. State Average, + 3.63 Inches.

Figure 4. -Precipitation, Departures From The Normal In Inches, April Through September 1951. State Average, -4.84 Inches.

# THE DROUGHT OF 1949-1952 (cont'd)

the dormant season. These are merely arbitrary terms for describing the two six month periods. Actually, the average frost-free growing season varies within the State from less than five months in parts of the west to nearly ten months on the outer banks of the coast. Figures 1, 3 and 5, give the departures from normal during the dormant season, while Figures 2 and 4 show departures during the growing seasons. Figure 6, depicting the growing season of 1952, includes only the four months April through July, because the unusually heavy rains of August would, if included in the totals, obscure the severe drought which prevailed until the last days of July. For most crops, these rains came too late to be of great benefit.

It can be seen from the charts that the extent and consistency of the drought varied considerably over the different sections of the State. The most consistent rainfall shortage was maintained over a few of the southern border counties of the Piedmont and interior Coastal Plain. These areas were dry month after month, almost without exception, and their accumulated rainfall shortage over the period of drought exceeded one-fourth of the normal amount (See Figure 7 for accumulated departures, October 1949 through September 1951). Other dry spots were a strip across the center of the Coastal Plain and another along the outer banks of the coast. In the mountains the situation was confused, as is often the case, because local topography so strongly influences the rainfall distribution. Just as the normally wettest and driest parts of North Carolina are less than 60 miles apart, so also it may be true that one part of a mountainous county consistently receives above-normal precipitation over a considerable period, while unrelieved drought prevails in another part of the same county. So great is this local variability that in some cases it cannot be shown in detail on a small chart such as those used here.

The average precipitation over the State and the departures from normal, by months, are shown in Table 1. It will be noted that 15 months had above normal amounts, and 21 months below normal. Four of the former had an excess of over an inch, and three of over two inches; fourteen of the latter were deficient by more than an inch, and five by more than two inches.

Since few of the drought periods in North Carolina weather history have lasted more than two years, it seemed reasonable to hope after the above-normal rains of the winter season 1951-52, that a well-watered growing season would follow. Such was not the case, however, the period from April through the fourth week of July was drier than any similar period during any of the three dry growing seasons. Heavy general rains during the last three days of July distort the picture somewhat, but Figure 6 for the four month period April-July, 1952, shows a rainfall shortage nearly equal to that of the entire six-month growing season of 1951.

Only the plentiful soil moisture provided at the beginning of the 1952 season from the heavy March rains prevented much more serious crop failure than that which occurred. Crops got a good start before soils became depleted, and the modest and infrequent rains of April and May were sufficient to enable most plants to make adequate growth. Thus, only those crops requiring large amounts of moisture during the maturing season suffered drastically from the severe drought and heat waves of June and July. Corn, hay and pastures fared badly, and both quality and quantity of tobacco were affected.

Although it has no particular bearing on the growth of summer crops, it is interesting to note that the dry weather continued through mid-November. Only three months of 1952, February, March and August, had normal or greater rainfall.

\*Prepared by the United States Weather Bureau Office, Raleigh, North Carolina

REPORT FOR THE FARM OR PLANTATION YOU ARE OPERATING  
For crops show acreage harvested and to be harvested this year

| ACRES OF ALL LAND IN THIS FARM OR PLANTATION. (Include land rented from others) | Acres in 1953 |
|---------------------------------------------------------------------------------|---------------|
| 1. Corn grown alone                                                             | 1             |
| 2. Corn grown with soybeans, cowpeas, or other crops                            | 2             |
| 3. Wheat harvested for grain                                                    | 3             |
| 4. Oats harvested for grain (include oats cut ripe for feeding unthreshed)      | 4             |
| 5. Barley harvested for grain                                                   | 5             |
| 6. Rye harvested for grain                                                      | 6             |
| 7. Sorghums for all purposes                                                    | 7             |
| 8. Irish potatoes, early (harvested before Sept. 1)                             | 8             |
| 9. Irish potatoes, late (harvested after Sept. 1)                               | 9             |
| 10. Sweet potatoes                                                              | 10            |
| 11. Alfalfa for hay                                                             | 11            |
| 12. Clover for hay                                                              | 12            |
| 13. All other hay                                                               | 13            |

### DISPOSITION OF 1952 SWEETPOTATO CROP AND ACREAGE FOR 1953

AVERAGE PRICES RECEIVED BY FARMERS FOR COMMODITIES GROWN IN YOUR LOCALITY

Monthly - January - December

| COMMODITY     | UNIT           | PRICE RECEIVED |
|---------------|----------------|----------------|
| Sweetpotatoes | Per 100 pounds |                |
| Cowpeas       | Per bushel     |                |
| Soybeans      | Per bushel     |                |
| Cottonseed    | Per ton        |                |
| Cotton lint   | Per pound      |                |
| Peas          | Per bushel     |                |
| Beans         | Per bushel     |                |
| Other legumes | Per bushel     |                |

### ACREAGE AND PRODUCTION OF CROPS

Report for each grain crop on the farm you are operating

Sum of acres in columns 2 to 7 should equal column 1. Do not report the same acreage more than once in columns 2 to 7

| CROP   | Harvested for grain | Used for pasture | Plowed under for soil improvement | Complete failure (not harvested, not pastured) | Acres |
|--------|---------------------|------------------|-----------------------------------|------------------------------------------------|-------|
| Wheat  |                     |                  |                                   |                                                |       |
| Rye    |                     |                  |                                   |                                                |       |
| Oats   |                     |                  |                                   |                                                |       |
| Barley |                     |                  |                                   |                                                |       |

### PECAN INQUIRY

May 1, 1953

PECAN SHEDDERS AND PROCESSORS INQUIRY

Report for each crop grown on the farm or plantation in 1953

| CROP                                               | Acres planted | Acres harvested and to be harvested | Total quantity harvested and to be harvested |
|----------------------------------------------------|---------------|-------------------------------------|----------------------------------------------|
| 1. Buckwheat                                       |               |                                     |                                              |
| 2. Irish potatoes (early) harvested before Sept. 1 |               |                                     |                                              |
| 3. Irish potatoes (late) harvested after Sept. 1   |               |                                     |                                              |
| 4. Sweet potatoes and yams                         |               |                                     |                                              |
| 5. All sorghums planted                            |               |                                     |                                              |

### COMMERCIAL BROILER PRODUCTION (Producer Schedule)

1/ Not available for previous years.

2/ Cottage cheese curd and creamed cottage cheese should not be added together to get a total cottage cheese figure, for while some of the cottage cheese curd is sold direct for consumption without further processing, a considerable part is creamed within the plant or shipped to another plant for creaming prior to sale.

3/ Revisited.

4/ Not comparable with previous years.

5/ Not available at time of publication of this issue.

Pounds of Grade "A" milk purchased from North Carolina producers in 1952 were three times the amount purchased in 1946 (See table above). The biggest percentage increase occurred in 1949 when purchases exceeded 1948 by 32.5 percent. Purchases in 1952 exceeded 1951 by 7.7 percent.

The number of Grade "A" producers in December 1952 almost double-

ed the number in December 1948. The largest increase in Grade "A" producers in a single year occurred in 1949 when there were 3,387 producers in December compared with 2,544 producers a year earlier.

Milk imports have declined since 1948. Imports reached a high of 78,799,151 pounds in 1948 and a low of 27,882,900 pounds in 1951 (See table above).

<sup>1/</sup> Large cigars.

<sup>2/</sup> Preliminary.

NOTE: No adjustment made for quantities lost, destroyed, bartered, etc., under war and postwar conditions, but such adjustments probably would be small in relation to total.

**Mechanization of N. C. Farms Continues**

Mechanization of North Carolina farms has continued at a rapid pace since 1940. The number of tractors, of all types, on farms on January 1, 1952 was more than seven times the number on farms April 1, 1940. The number of motortrucks increased almost four times during the same period, see table below.

**Farm Power and Farm Machines, 1940-1952, North Carolina**
