

NORTH CAROLINA

Agricultural Statistics

TOBACCO

Featuring County Estimates, 1925-1958

JANUARY-1960

FOREWORD

This publication, which is devoted entirely to tobacco, is the first in a series to be issued for each major crop produced in North Carolina. It has been prepared in response to a sharp increase in the number of requests for historical information on crop acreages and production at the county level.

County estimates on the acreage, yield, production, price and value of tobacco from 1925 through 1958 are shown on pages 8 through 21. Statistics at the State level start with 1866 for "All tobacco" and with 1919 for tobacco by types.

The publication of these data is made possible through a special project whereby State funds are matched with Federal funds received from the Agricultural Marketing Service, U.S.D.A., under provisions of the Agricultural Marketing Act of 1946.

INTRODUCTION

Either flue-cured or burley tobacco was grown in 89 of the State's 100 counties in 1959. According to the State A.S.C. Office, there were about 122,000 farms with flue-cured allotments and about 18,000 farms with burley allotments in 1959. Statewide, flue-cured allotments averaged about 3.9 acres per farm while burley allotments averaged less than six-tenths of an acre per farm.

North Carolina far outranks any other State in the production of tobacco. Kentucky is the second ranking state and normally produces less than half the amount produced in North Carolina. During recent years, North Carolina has produced approximately two-thirds of the Nation's flue-cured production and approximately two-fifths of all tobacco produced in the United States.

Although the percentage of total cash receipts coming from tobacco has declined slightly during recent years, tobacco still contributes a major portion of the total cash income derived from farming in North Carolina. In 1957 and 1958 tobacco accounted for 61.9 and 63.0 percent, respectively, of the total cash receipts from sales of all crops. Tobacco also accounted for 43 percent of total cash receipts from sales of all commodities -- all crops, livestock, and livestock products.

Several developments worthy of note with respect to the production of tobacco occurred during the past decade, i.e., 1950 through 1959. The acreage of both flue-cured and burley tobacco trended downward rather sharply during this period. Follow-

ing the approval of marketing quotas, acreage allotments were determined for individual farms during each year of the decade. The acreage of flue-cured tobacco in North Carolina declined from a high of 735,000 acres in 1951 and 1952 to a low of 429,000 acres in 1958 (see page 6). The record flue-cured acreage in the State was set with 843,000 acres in 1939. The reduction in acreage has been partially offset by higher per acre yields. Higher per acre yields resulting from the development of new varieties and improved cultural practices were particularly noticeable during 1955 and subsequent crop years. The record flue-cured production in the State was set in 1955 with 978,775,000 pounds from 653,000 acres for an average yield per acre of 1,499 pounds. The record high flue-cured yield per acre of 1,718 pounds was set in 1958 under practically ideal weather conditions. The 429,000 acres harvested in 1958 was 41.6 percent less than the 735,000 acres harvested in 1951 and 1952; however, production during 1958 was only 21.5 percent below the average of 1951 and 1952.

During the decade 1950 through 1959 the acreage of burley tobacco in North Carolina ranged from a high of 12,700 acres in 1954 to a low of 9,300 acres in 1958. Although burley yields have not advanced percentagewise as fast as flue-cured, the 1958-59 average was 300 pounds above the 1950-51 average (see page 7). The record high burley acreage was set in 1945 with 13,000 acres, and a new record yield per acre of 2,050 pounds was set in 1959.

PRODUCTION AND MARKETING OF TOBACCO IN NORTH CAROLINA^{1/}

Tobacco Plant Beds

The production of tobacco probably seems rather simple to people who have grown up with it, but to others the many steps and processes involved in producing, harvesting, and marketing a crop of tobacco may not be quite so simple.

The first step in producing a crop of tobacco involves the preparation of a seed bed during the winter months for the tiny tobacco seed. The seed are so small that it takes 442,970 seeds to make one ounce, or three tablespoonfuls. If all the seed in one ounce should produce strong healthy plants, there would be enough plants to set approximately 64 acres of tobacco. Actually, many of these delicate seed will fall on rough ground and die, others will be killed by the cold weather and some plants will be killed by insects and disease. Therefore, the average grower usually sows about one-third of an ounce, or one tablespoonful of seed per 100 square yards of plant bed, and he usually prepares about 100 square yards of plant bed for each acre of tobacco he intends to plant so that he can be assured of having enough plants to set his crop.

The plant beds, which are sowed in different sections of North Carolina from December through the early part of March, are covered with mesh cotton canvas early in the spring before the seed sprout, to protect the seedlings from the cold and frost. After danger of frost, the cover is removed and the seedlings are developed and toughened so that they can be transplanted to the field. It takes from 8 to 12 weeks from the time the seed are sown until the plants are ready to set.

Setting Tobacco

After strong healthy plants with good root systems are developed in the plant bed, they are then transplanted to the field. The transplanting of tobacco is usually started early in April in the Southeastern part of North Carolina and planting is continued in the Piedmont and Mountain sections of the State through the middle of June. The plants are set 18 to 24 inches apart in rows which are 3½ to 4 feet in width, and it takes from 6,000 to 8,000 plants to set an acre of tobacco, depending upon the spacing.

The process of transplanting tobacco is done in several different ways by different farmers over the State. Some of the larger tobacco growers use tractor drawn transplanters that will set two rows at the time, others use one row horse or tractor drawn planters, and some of the smaller growers still use hand planters to set their crops. All of these transplanters, whether tractor or horse drawn, or hand planters, are equipped to supply water to each plant as it is set in the row. However, some farmers still follow the old back-breaking practice of setting tobacco with a short peg after a rain has wet the prepared fields.

The average number acres of flue-cured tobacco planted in North Carolina each year ranges from about 450,000 to 750,000 acres, depending upon the adjustments made in quotas under the tobacco control program, which keeps the supply in line with demand.

Cultivation

Growing good tobacco is a highly specialized business which is guided largely through experience and research. Tobacco is a clean cultivated crop which requires a large amount of fertilizer, 800 to 2,000 pounds per acre, and much hard work. Cultivation of the crop is started soon after the plants are set in the field. The rows of tobacco are harrowed or plowed from 3 to 5 times, during the first 5 or 6 weeks after transplanting, to keep the grass and weeds down, and to loosen the soil and push it to the tobacco plants. The last plowing, known as 'laying the crop by,' is usually done about the time the plants are knee high.

A few weeks after the crop has been 'laid by' the plants of tobacco begin to bloom. These blooms are broken out so that the top leaves on the plants will develop. After the tobacco plants have been topped, a sucker grows at the base of each leaf. This sucker is either broken out by hand labor, or controlled through the use of sucker control chemicals.

There are many insects and pests that prey on tobacco during the growing season, which must be kept under control or the crop of tobacco will be destroyed. Growers have to spray and dust their tobacco with poisons several times during the

growing and harvesting season to keep these insects and nests under control.

Harvesting

Harvesting tobacco is one of the most laborious tasks that exists in North Carolina, and probably in the United States. Competition has forced growers of most crops to mechanize and do less hand work, but with tobacco, almost every step to improve quality has called for more instead of less hand labor. It takes approximately 440 man-hours of labor to produce, harvest and market an acre of tobacco of which about 132 man-hours are accounted for in the harvesting.

The laborious job of harvesting flue-cured tobacco begins during the latter part of June in Southeastern North Carolina and continues through the middle of September in the Piedmont section of the State. In harvesting flue-cured tobacco, each leaf has to be primed individually as it matures and ripens. This is accomplished by priming the crop over each week, pulling 2 to 4 leaves from each plant every week, depending upon the ripeness of the leaves. As the leaves are primed, they are put in narrow sleds which are pulled between the rows. When a sled has been filled it is carried to the curing barn where a crew of two handers pick the leaves up in hands of 2 to 3 leaves and hand them to a stringer, who loops the hands of tobacco to a stick. The sticks of tobacco are either piled or hung in racks, later the sticks of tobacco are hung in the curing barn which are 5 to 7 tiers high.

There are 100,000 to 150,000 leaves in an acre of flue-cured tobacco, and all of these leaves have to be handled about 10 times during the harvest season. It usually takes 5 to 8 weeks to harvest a crop of flue-cured tobacco. In recent years mechanical harvesters have been used by a few farmers. However, the biggest advantage that the harvester affords is that it lets the primers sit while they prime the leaves.

Curing Bright Tobacco

The process of curing a barn of tobacco to a rich golden color requires

PRODUCTION AND MARKETING OF TOBACCO IN NORTH CAROLINA

a skill which is developed only through years of experience. An average size barn will hold 600 to 800 sticks of tobacco which contain 60,000 to 80,000 leaves. A barn of tobacco has 7,000 to 8,000 pounds of water imbibed in the tiny cells of the leaves. Therefore, the main objective in curing tobacco is to eliminate the excess water from the leaves in such a way as to give the tobacco a bright golden color, and this is done by the use of artificial heat.

Artificial heat is supplied to tobacco barns in various ways. Some growers use the old conventional method of stoking a wood fired furnace 24 hours a day by hand. Other growers use automatic thermostatically controlled coal and oil burning stokers, but in recent years the majority of the growers in North Carolina have used manual controlled oil or gas burning units which vary considerably with make, or brand name.

The process of curing flue-cured tobacco is divided into three phases. First is the yellowing period in which the green color in the leaves is changed to a golden yellow color. The next step is the color setting and leaf drying phase. Then comes the stem drying phase. It usually takes 65 to 75 hours to cure a barn of tobacco.

After a barn of tobacco has been cured, the doors are opened to allow the barn to cool. Then the tobacco, which is very porous, absorbs moisture from the night air which brings it into case or order, so that it can be removed from the barn without breaking and packed in a packhouse.

Sorting for Market

After curing, the tobacco is removed from the curing barn and stored in a packhouse until all of the crop has been harvested and cured. The next step is sorting the leaves into uniform grades for marketing. The procedure is to remove the leaves from the stick on which they were cured and to pick out the leaves that match in color, thickness and length. Then twenty to twenty-five leaves are tied into a 'hand' or bundle at the 'butt' or stem end with another leaf. This process is followed until the entire barn or curing has been sorted into matching grades and tied into bundles. Usually there are three different grades to a curing, such as the best grade, medium grade and those leaves with green, or immature tobacco going into a low or common grade. These lots are kept separate and marketed as three different grades.

Selling Tobacco By Auction

Tobacco is marketed under the auction system of selling. In North Carolina there are markets located in 47 towns throughout the State. Each local market has several auction sales warehouses for the farmers' convenience. Upon arrival at the market the grower has his tobacco unloaded by a warehouse employee and packed upon a wicker basket, about 38 inches square, according to the grade he sorted out at home. Each lot is then weighed by a weigh-master licensed by the State for weighing tobacco. The weigh-master places a ticket on each lot with the farmer's name, weight of the tobacco and basket number for identification. The tobacco is then placed on the warehouse floors in rows ready for the auction to begin.

The tobacco auction is unique in the sale of farm commodities, and an experience worthwhile to the uninitiated. Prior to the beginning of the sale a Federal tobacco grader inspects each lot of tobacco on the warehouse floor and places a U. S. Standard grade on it. The significance of this operation is that under a price support program each Federal grade is supported at 90 percent of parity. If any lot placed on the floor by the grower does not bring a price in the auction sale above the support price, the Stabilization Corporation pays the grower the support price established for that particular grade, and then the tobacco is taken over by the Stabilization Corporation for future sale.

The actual auction sale is participated in by buyers representing domestic and foreign companies. At the beginning of the auction the buyers line up on one side of the row of tobacco directly across the row from the warehousemen, the auctioneer, and a ticket marker. The warehouseman starts the auction with the first bid, based on his judgment of the market price of each lot according to quality. However, like any article being sold at auction, the buyers have different ideas of the value. At this point the auctioneer cries the warehouseman's bid and buyers take over, signifying their bids in various ways: by winks, signs or sounds, until in the judgment of the auctioneer, the lot of tobacco has brought the top dollar. The auctioneer then names the buyer and the price paid for the lot sold. This procedure continues at a rate of 300 to 400 piles per hour until the warehouse has sold its allotted number of piles for the day.

As the auction sale goes along, directly behind the sale, comes the book and clip men. These two are rapid calculators, who figure the number of pounds by the price paid by the buyer and have the complete transaction figured for the buyer and seller within a matter of seconds.

Every buyer has a crew following the sale to pick up his purchases and place them together according to the grade. Each grade of the buyer is placed together for movement to a redrying plant.

Redrying for Storage

Although tobacco has been cured before it is sold, it still has to be redried before it is stored for aging. As tobacco is sold on the warehouse floors it is in the 'raw' stage, that is, it contains too much moisture to pack into 'hogheads' for the aging process. This excess moisture must be removed and a predetermined amount of moisture left in to insure proper aging for the manufactured product. To remove the excess moisture the tobacco is run through a redrying machine. This machine is similar to a large oven through which the tobacco passes, removing all moisture. Then it passes into a live steam chamber where the exact amount of moisture is replaced. The tobacco is then packed into 'hogheads' or large casts, weighing about 900 to 1,000 pounds, and pressed tightly by hydraulic press. These hogheads are then ready for storage and aging. Tobacco usually is left in storage from two to three years. During the aging period the tobacco sweats or goes through a slight fermentation which mellows the flavor for use in the finished product.

Manufacturing Process

Cigarettes are by far the leading manufactured tobacco product in this Country. The production of cigarettes utilizes about 95 percent of the crop of flue-cured tobacco in making more than 400 billion cigarettes annually. If all of these 400 billion cigarettes were laid end to end around the world at the equator, there would be enough to reach around the world more than 700 times. This is an average of about 2,500 cigarettes for every man, woman and child in the United States annually. The modern cigarette machines will make 1,200 to 1,500 cigarettes per minute.

NORTH CAROLINA TOBACCO, ALL TYPES, 1866-1958

Crop Year	Acres Harvested	Yield Per Acre	Production	Price Per Pound	Value Of Production

EXPORT MARKETS FOR U. S. TOBACCO

UNMANUFACTURED, DECLARED WEIGHT, FISCAL YEAR

U. S. DEPARTMENT OF AGRICULTURE

NEG. 3484-59 (8) AGRICULTURAL MARKETING SERVICE

Exports of unmanufactured tobacco in 1958-59, at 473 million pounds (equivalent to 529 million, farm-sales weight), were virtually the same as in 1957-58 but 1 percent below the 1948-57 average. During 1958-59 compared with a year earlier, appreciably smaller exports of U.S. tobacco went to

United Kingdom, Netherlands, Australia, Switzerland, Thailand, Sweden, Spain and Indonesia. These declines were offset by substantial increases in exports to Germany, Italy, Japan and Viet Nam, and lesser increases in exports to Belgium, Ireland, Denmark, Portugal, Finland, Philippine Republic and Taiwan.
