FOREWORD

Prepared By Robert H. Tilley, *Agricultural Statistician*

The 1964 apple and peach tree surveys were designed to provide a new bench mark for appraising the present and projecting the future in the fruit industry of North Carolina. No similar survey had been undertaken in the State since 1954, and there had been many changes in fruit production during the intervening years. The surveys were made at the request of the North Carolina Apple Growers Association and the North Carolina Peach Growers Association. They were also designed to fill the needs of marketing specialists and handlers of fruits for planning current and future operations. Commercial peach orchardists were surveyed after completion of harvest in the fall of 1964, while apple orchardists were surveyed early in 1965.

The two separate surveys were made possible through the use of Agricultural Marketing Administration funds matched by State funds available to the Statistics Division of the Department of Agriculture.

Inquiries were mailed to all known commercial producers of apples and peaches, and those who did not respond to either the first, second, or third request by mail were contacted by personal interview. The surveys disclosed a total of 961 commercial orchards in the State -- 742 apple orchards and 219 peach orchards. Reports were received by mail from approximately 450 of these orchardists with the remainder received through personal interview.

For the purpose of these surveys, a commercial orchard is described as an orchard with 100 or more apple or peach trees main-

tained for production of fruit. Lists of commercial growers were compiled through records already available in the Statistics Division and from additional names supplied by the County Extension Chairmen in each county of the state. Interviews of non-respondents to the mailed inquiry were made: (1) by statisticians of the Statistics Division, (2) by special enumerators employed on a part-time basis, and (3) by personnel in the offices of the County Extension Chairmen.

Orchardists were asked to provide detailed information about the number of trees by varieties and by ages with 1964 production of fruit reported by varieties. Since the 1964 peach crop had been severely damaged by late spring freezes, peach growers were asked also to report 1963 production by varieties.

Because of the recent interest in the planting of dwarf and semi-dwarf apple trees, separate information was collected on these trees. Although production of apples from dwarfing varieties had not reached appreciable proportions by the time the surveys were conducted, plantings of such trees during the years immediately preceding the surveys has been fairly heavy.

Particular appreciation is expressed to the 961 commercial apple and peach growers for their cooperation in furnishing information about their orchards. Special acknowledgment is due also to Extension horticulturists at North Carolina State University for their assistance in designing the questionnaire forms and in the selection of varieties to be included on the inquiries.

ACKNOWLEDGEMENT

Special acknowledgement is extended to Mr. M. H. Kolbe, Franklin E. Correll and M. E. Gardner of The Horticulture Department, N. C. State University and County Extension Chairmen and Agents in Commercial Apple and Peach producing counties.

This publication brings the 1954 survey

of apple and peach orchards up to date. The clerical work was supervised by Catherine Haig and the data were assembled by Martha Early and Winifred Karangelen, Vari-typing by Evelyn Finch and duplicating by Raymond Alford and Charles Cross.

NORTH CAROLINA COMMERCIAL APPLE ORCHARD SURVEY

Summary

NUMBER OF ORCHARDS AND ACRES

In the survey of North Carolina apple orchards, a commercial orchard was defined as an orchard with 100 or more trees maintained for production. There were 742 commercial orchards reported in the survey. Separate tabulations are given in the tables for the 19 most important counties. Henderson county reported the largest number of orchards with 342 and the next largest was Wilkes with 48 orchards.

A total of 15,806 acres of land was used for apple orchards in North Carolina. Of this total, 14,130 acres were in Mountain Counties and 1,676 acres were in Piedmont and Coastal Counties. Henderson County had the largest acreage in commercial orchards with 7,671 acres and Wilkes was second with 1,723 acres. Haywood County was third with 1,177 acres and the acreage in the remaining counties as shown separately on the tables to follow, ranged from 95 to just above 600. The total acreage devoted to apple orchards in 1954 was 20,360 and this compares with 15,806 acres in 1964, a decrease of 22%.

NUMBER AND AGE OF TREES

There were 817,185 trees reported in the survey of commercial apple orchards and 455,053, or 55.7 percent of these were trees of bearing age. Bearing trees were defined as all trees on standard rootstocks eight years old and over and size controlled trees (dwarfing rootstock and/or spur types) 4 years and over. Non-bearing trees 1 year old totaled 125,016, or 15.3 percent of the total; trees 2 to 3 years old totaled 134,409 or 16.4 percent; and trees 4 to 5 years old totaled 103,790 or 12.7 percent.

Henderson County with 388,254 apple trees of all ages led all counties and accounted for 47.5 percent of the total trees in commercial apple orchards in the State. Other principal counties in order of importance by number of trees were: Wilkes with 76,642; Haywood with 56,266; Mitchell with 37,678; and Alexander 34,237. A large portion of the trees from one to four years of age were Red or Yellow Delicious Spur type trees. The Spur type Red and Yellow Delicious trees accounted for 39 percent of all non-bearing trees.

VARIETIES

The strains of Red Delicious are by far the most

popular of all the varieties grown in North Carolina. Red Delicious strains accounted for 394,942 trees or 48 percent of all trees. Yellow Delicious was second with 131,299 trees; Rome Beauty was third with 131,184 trees; Stayman was fourth with 82,178 trees; and Limbertwig was fifth with 10,222 trees. The variety table includes 19 other minor varieties. Most of these are disappearing rapidly and they are being replaced with the very popular Spur type Red and Yellow Delicious. If recent trends continue, we will have only four major commercial varieties grown in North Carolina within a few years, and they will be Red and Yellow Delicious, Rome Beauty, and Stayman.

PRODUCTION 1964

The survey was designed to obtain apple production by varieties for the 1964 crop. Production in 1964 from the 742 commercial orchards totaled 1,794,192 bushels for an average of 3.94 bushels per tree of bearing age. Adverse weather at polination time for the Red Delicious caused a very poor set of fruit in 1964. Production by varieties in bushels was Rome Beauty 625,390; Red Delicious 416,857; Yellow Delicious 294,062; Stayman 223,356 and Limbertwig 40,245. A large number of Spur type Red and Yellow Delicious are now coming into production and production from these varieties will predominate in the near future.

FUTURE PRODUCTION TRENDS

The commercial production of apples in North Carolina is expected to continue on an upward trend for many years. Growers are pulling out old and unprofitable varieties at a rapid rate and replacing them mostly with Spur type trees which come into production after 4 or 5 growing seasons. A large portion of the trees set in the past 3 years were Spur type Red and Yellow Delicious. Plantings of these strains are expected to continue at a rapid pace. Growers with some of the older Spur type trees have been extremely well pleased with the quality and quantity of fruit produced.

1/ Orchards with 100 or more trees of all ages maintained for production.

2/ Standard trees less than 8 years of age; size controlled trees (dwarfing rootstock and/or spur types) less than 4 years of age.

3/ Standard trees 8 years old and over; size controlled trees (dwarfing rootstocks and/or spur types) 4 years and over.

4/ Includes small quantities produced from trees classified as non-bearing age.

NUMBER OF COMMERCIAL ORCHARDS

For use in this survey a commercial orchard was defined as any orchard with one hundred or more trees maintained for production. A total of 742 commercial orchards were reported for the State. There were 622 orchards located in the Mountain Counties, 110 in the Piedmont Counties, and 10 in the Coastal Counties. Henderson county had the largest number of orchards with a total of 342, Wilkes was second with 48, Haywood third with 45, Mitchell fourth with 41 and Alexander

fifth with 36. These five counties had a total of 512 orchards or 69 percent of the State total.

North Carolina had a total of 15,806 acres in commercial apple orchards in 1964 and this is 4,554 acres below the 20,360 acres reported in the 1954 survey. The counties showing the largest decline in number of acres were Alexander and Buncombe while smaller declines were reported for Yancey, Henderson, Wilkes and Haywood.

L/ Includes small quantities of fruit produced from trees classified as of non-bearing age.

APPLE VARIETIES

The number of varieties of apples grown for commercial market in North Carolina continues to decline. Four varieties now account for ninety percent of the trees in commercial orchards. These four are Red Delicious 48 percent of all trees; Yellow Delicious 16 percent; Rome Beauty 16 percent and Stayman 10 percent. The next most important variety was Limbertwig with a little over one percent.

The names of the twenty-three most important varieties in North Carolina are given above. Many of these are old varieties used for home use and local sales and they continue to decline in number of trees. The commercial early maturing varieties also are continuing to show a downward trend. The late maturing varieties are disappearing. Only a very few young trees in this category have been set in recent years.

BEARING AND NON-BEARING TREES

Non-bearing trees for this survey included all standard rootstock trees less than eight years of age and size controlled trees (dwarfing rootstock and/or Spur types) less than four years of age. On this basis there were a total of 362,132 trees classified as non-bearing or 44 percent of the total, and 455,053 or 56 percent as bearing age trees. In the non-bearing age

group 344,809 trees or 95 percent of the total were trees of the four leading varieties, Red Delicious, Yellow Delicious, Rome Beauty and Stayman. A further analysis shows that 82 percent of these are planted to Red and Yellow Delicious. In the one year old trees 89 percent of the total was either red or yellow Delicious.

ACRES AND NUMBER OF TREES

Henderson county has 7,671 acres, the largest in the State, and about 49 percent of the total acres. Wilkes is second with 1,723 acres or 11 percent of the total and Haywood is third with 1,177 acres and a little over 7 percent of the State total.

Counties that have had large increases in acres of apple trees are Avery, Mitchell, Watauga, Lincoln and Rutherford. The acreage in most of these counties is about double that reported in 1954.

A total of 817,185 trees were reported in the survey. The mountain counties had 717,847 trees or 88 percent of the State total. Piedmont Counties reported 91,168 trees or 11 percent, and the Coastal Counties had 8,170 or about 1 percent. Counties with the largest number of trees were as follows: Henderson, Wilkes, Haywood, Mitchell, Alexander. The percent of the total by counties was as follows: Henderson 48, Wilkes 9, Haywood 7, Mitchell 5, and Alexander 4.

PRODUCTION

Growers reported 1,794,192 bushels of apples harvested from the 1964 crop with an average of 3.94 bushels per tree of bearing age. The percent full crop by varieties varied greatly in 1964. Some sections had almost a crop failure, due to late spring freezes, while others had near a full crop. Most

orchards in the Wilkes County area located on high elevations had a failure while the few orchards in the lower valleys had a good crop. In Henderson County most growers had a very light crop of Red Delicious, Yellow Delicious and Stayman while practically every orchard had a full crop on the Rome Beauty variety.

NORTH CAROLINA COMMERCIAL PEACH ORCHARD SURVEY

Summary

NUMBER OF ORCHARDS AND ACRES

In the survey of North Carolina peach orchards, a commercial orchard was defined as an orchard with 100 or more trees maintained for production. A total of 219 commercial orchards was reported in the survey. Orchards with 1,000 to 2,499 trees were most popular and there were 51 of these. The next most popular size was 500 to 999 trees and a total of 49 was reported. There were 13 orchards in the State with more than 10,000 trees.

A total of 6,107 acres of land was reported in the 219 commercial peach orchards. Montgomery County with 1,895 acres in commercial peach orchards led all other counties; Moore County was second with 1,015 acres; and Richmond County was third with 931 acres.

NUMBER OF TREES

Peach trees reported in the survey for all commercial orchards totaled 572,700. In the Sandhills area Montgomery County had a total of 177,951 trees; Moore County 93,800 trees; and Richmond County had 92,440 trees. In the Southern Piedmont, Rutherford County reported 40,410 trees and Polk 28,900 trees. The number of trees in the Sandhills and Southern Piedmont Counties has continued on a downward trend.

AGE OF TREES

Of the 572,700 trees of all ages there were 480,894 trees or 84 percent of the total which were reported as trees of bearing age (4 years old and over). Trees 1 year old amounted to 50,022, or 8.7 percent of the total, while 41,784 trees or 7.3 percent were 2 or 3 years old. There were 23,338 trees in the 16 years and older category. The largest number of trees, 275,289 or 48 percent of the total, was in the 6 to 10 year age group.

VARIETIES

The Elberta variety continued as the leading variety of peaches grown in North Carolina. There were 60,808 trees of all ages reported as Elbertas and they accounted for 10.6 percent of all trees. Other leading varieties were Blake with 43,900; Cardinal with 37,867; Redhaven with 35,505; Southland with 35,386; and Dixireds with 33,515. The leading varieties in the non-bearing age bracket were Loring, Blake, and Redskin. Richmond County has the largest number of trees in the non-bearing age category while Montgomery and Moore take second and third places, respectively.

PRODUCTION 1963 AND 1964

Since the 1964 peach crop was severely damaged by a late spring freeze, the survey was designed to obtain information on production in 1963 as well as in 1964. Production of peaches in 1964 from these commercial orchards amounted to 124,257 bushels for an average of 0.26 bushels per tree of bearing age. Production in 1963 from these same orchards was reported at 769,750 bushels or 1.60 bushels per tree of bearing age. Production from Montgomery County in 1963 amounted to 247,757 bushels of peaches or 32 percent of the total commercial harvest. Moore County was second in production with 122,128 bushels in 1963 while Richmond was third with 116,985 bushels.

FUTURE PRODUCTION TRENDS

The number of commercial peach orchards in the Sandhills and in the Southern Piedmont Counties is expected to continue the downward trend of recent years. New plantings in recent years have not been sufficient to offset the large number of orchards going out of production.

TOTAL TREES..... 103,864			

In addition to the seventeen varieties listed on the schedule, space was provided for the grower to list any other variety grown. Growers reported about fifty other named varieties along with some unknown varieties. The number of trees reported in other varieties and unknown was 89,433. They are all shown as "Other Varieties" in the State and County tables.

The sixteen most important minor varieties written in on the schedule by the growers are listed in the above table along with the number of trees for each variety. The total number of trees reported for these sixteen varieties was 103,864. Red Globe, Richhaven, and Triogem were the three most important varieties in

this group.

In addition to these minor varieties there were thirty seven other minor varieties listed with even smaller numbers of trees. This group of varieties had a total of 8,292 trees. Some of the more important varieties were Afterglow, Fairhaven, Highland, Lizzie, Duke of Georgia, Brackett, Golden East, Clings, Hiley Belle, New Day, Honeydew Hale, and Summer Crest.

There were 6,200 trees reported for which the growers did not know the variety name. These unknown varieties ranged in age from one year to over sixteen years.

NORTH CAROLINA PEACH TREE SURVEY - 1964

SPECIAL INSTRUCTIONS: Do not include acres or trees in mature standing orchards which are not being maintained for production and from which no peaches have been harvested during the past two seasons.

1. Peach acreage and number of trees by counties: (If you operate peach orchards in more than one county please show the acreage and number of trees separately for each county).

County _____ Acres in peaches _____ Total Number Trees of All Ages _____
 County _____ Acres in peaches _____ Total Number Trees of All Ages _____

2. Total production of peaches: 1964 _____ bushels. 1963 _____ bushels.

3. What is the net weight of the "bushel" as reported in item 2? _____ pounds.

4. Please supply the variety information requested below for peach trees reported in item 1.
