North Carolina

AGRICULTURAL STATISTICS

1971 Issue

FOREWORD

North Carolina's prominence in the industry of Agriculture, both nationally and worldwide, is a natural reality. Three major regions -- mountains, piedmont and coastal plains -- comprise the State's 16 million acres of farmland. A diversity of elevations, numerous rich soil types, and a moderate climate -- coupled with industrious farmers -- provide a large volume and wide variety of quality agricultural products for domestic consumption and export.

North Carolina's modern seaports, waterways, and land transport systems provide a dependable means for rapid and efficient movement of agricultural and industrial products. The extensive agricultural industry supports and complements many major manufacturing industries within the State.

With annual cash income from all farm products exceeding \$1.5 billion, North Carolina ranks eleventh among states in the Nation. The state ranks fifth in cash income from crops and eighteenth in cash income from a rapidly expanding livestock and poultry industry.

For the state to maintain a favorable position in the production and disposition of agricultural production, detailed and timely information must be made available. The North Carolina Crop Reporting Service has prepared this volume of "Agricultural Statistics" to fulfill in large measure the needs for serviceable data about the state's agriculture. Information contained in this publication tells much about the diversity, progress, and vitality of our agriculture.

We wish to thank the many thousands of dedicated farmers, agribusinessmen, and others associated with agriculture who have contributed basic facts to make these statistics possible.

Introduction

NORTH CAROLINA AGRICULTURAL STATISTICS brings together the more important series of current and historic statistics concerning agriculture in the State. Where possible, types of information most often requested by farmers, by the general public and workers in other Government agencies are included. Semi-monthly releases entitled 'Farm Report' and various other periodic releases are published to meet the needs of persons requiring information on a weekly, monthly or seasonal basis.

Crop and livestock reporting is a service rendered to farmers and others in the State by the Statistical Reporting Service of the U. S. Department of Agriculture in cooperation with the North Carolina Department of Agriculture. The collection and dissemination of agricultural statistics is the oldest activity of the United States Department of Agriculture, having had its start in 1863 during the Civil War. Recognizing the many advantages of a joint relationship between the State and Federal Governments in the development of agricultural statistics, North Carolina, in 1919, entered into a cooperative agreement with the U. S. Department of Agriculture to provide detailed agricultural statistics. The agreement resulted in the creation of the Statistics Division of the North Carolina Department of Agriculture.

OFFICIAL ESTIMATES PUBLISHED

The North Carolina Crop Reporting Service publishes official statistics on crop and livestock production, prices and various other special reports. A list of the more important reports and the approximate date of release is shown in the table at right. These reports may be obtained without charge, by writing to Agricultural Statistician, P. O. Box 27767, Raleigh, North Carolina 27611.

TYPE OF REPORTS	Frequency Of Report	Approximate Date Available In Raleigh
I. CROP REPORTS		
1. Intentions to Plant	Annually	March 20
2. Farm Report	Monthly	12th
3. Cotton	July-Dec.	8th of month
4. Vegetables	Monthly	10th
5. Crop Production, Disposition & Value	Annually	May 12
6. Grain Stocks (All Positions)	Quarterly	25th, Jan., Apr. July & October
7. Annual Crop Summaries: Small Grains	Annually	December 10
Other Field Crops	Annually	January 15
II. LIVESTOCK REPORTS		
1. Cattle & Milk Cow Inventory, Jan. 1	Annually	February 8
2. Cattle & Calves on Feed, Jan. 1	Annually	January 17
3. Calf Crop	Semi-annually	Feb. 15, July 24
4. Spring Pig Crop & Hog Inventory, June 1	Annually	June 25
5. Fall Pig Crop & Hog Inventory, Dec. 1	Annually	December 24
6. Sheep Inventory, January 1	Annually	February 8
7. Lamb Crop	Semi-annually	Feb. 21, July 28
8. Commercial Slaughter	Monthly	30th
9. Meat Animals - Farm Production, Disposi- tion & Income	Annually	April 27
III. DAIRY REPORTS		
1. Cows Milked & Milk Production	Monthly	15th
2. N. C. Dairy Report	Semi-annually	Feb. 15, Aug. 15
IV. POULTRY REPORTS		
1. Poultry Inventory, January 1	Annually	February. 8
2. Eggs, Chickens, Turkeys & Hatchery;	Monthly	18th
Poultry Slaughter	Weekly	Wednesday - P.M.
3. Broilers	Semi-annually	Aug. 25, Jan. 29
4. Turkeys Raised		
V. PRICE REPORTS		
1. Prices Received by Farmers	Monthly	1st
2. Prices Paid by Farmers for Feed	Monthly	1st
3. Prices Paid by Farmers, Selected Items	Quarterly	1st Feb., May, Aug., and Nov.
VI. WEATHER-CROPS REPORTS	Weekly	Monday - P.M.

NORTH CAROLINA CROP REPORTING DISTRICTS

North Carolina is divided into eight Crop Reporting Districts as outlined on the map below. County estimates for both crops and livestock are compiled by Crop Reporting Districts, and the counties within each district are listed in alphabetical order.

This publication is the 123rd in a series on Agricultural Statistics for North Carolina. The vari-typing was done by Evelyn L. Finch and Minnie H. Langley. The duplicating work was done by Raymond R. Alford, Jr., Charles H. Cross, Jr. and Kay Matthews. Statistical editor; Martha E. Early.

Hurricane Ginger and Rains Damage Crops

1971 was somewhat of a paradox as far as crop production was concerned. Production of many crops was bountiful while the outturn of others was rather discouraging.

Soil and weather conditions during the 1971 planting and growing season were generally about normal. The early planting season was somewhat colder and wetter than desirable but conditions during the late spring and summer were generally quite favorable.

Conditions were near ideal for small grains throughout the season. May rains promoted a good "fill" but some lodging occurred. Yields tied or bettered previous records. Harvest progressed a little behind 1970 but was about normal. The flue-cured tobacco crop was also very good.

The outturn of most fall crops was well below early season expectations. Hurricane Ginger and the record rainfall that followed during October caused severe qualitative and quantitative losses to crops remaining in the fields. Damage was particularly severe to corn, cotton, soybeans, peanuts, and sorghum grain.

Crop Cash Receipts Decline

Cash receipts from the marketing of crops in N. C. during 1971 declined to about \$906 million (preliminary estimate), down 1 percent from the \$919 million during 1970. The State ranked sixth nationally, down from fifth place in 1970.

Gains registered in receipts from corn, cotton, sorghum grain, soybeans, small grains and sweet potatoes were more than offset by lower cash receipts from tobacco, peanuts, Irish potatoes and apples. Wet weather associated with and following Hurricane Ginger cut market receipts from many crops substantially. Lower prices for some items also took a heavy toll.

1971 Harvested Acreage Up

Harvested acreage of the major crops increased for the second consecutive year in 1971. Principal crops harvested by Tar Heel farmers totaled 4,450,000 acres -- 8 percent above the 4,123,000 acres harvested in 1970. This increase was due mainly to larger acreages of grains and soybeans which more than offset the smaller tobacco acreage.

Flue-Cured Leaf Production Lower

Reduced acreage more than offset near record yields in 1971 as flue-cured tobacco output dropped below 1970. Tar Heel growers produced 713 million pounds of flue-cured leaf in 1971 -- 11 percent below 1970. The 1971 yields were the highest ever under the acreage-poundage program but failed to reach the 1964 record. Yields averaged 2,102 pounds per acre compared with 2,076 pounds in 1970. From transplanting through harvest, conditions were near ideal for the crop.

Average price per pound was a record breaking 77.5 cents. The 1971 crop was valued at \$552 million, the second highest, falling just short of the 1970 record of \$571 million.

The 1971 burley crop was valued at \$11.5 million, down from \$13.5 million the previous season. Prices averaged a record high 79.8 cents per pound. The preliminary estimate of production is 14.5 million pounds from 7,000 acres for a yield of 2,065 pounds. The crop was set late, grew fast, and cured out light. The burley area received excessive rainfall during much of the growing and harvest season.

Cotton Outturn Down

The State's 1971 cotton crop is estimated at 135,000 bales -- 13 percent below the 1970 crop. Wet weather prevailed during much of the harvest season causing an unusually high abandonment of 9 percent. About 175,000 acres were harvested yielding an average of 371 pounds of lint per acre -- 93 pounds below the near record yield a year earlier. Farmers received an average of 29.7 cents per pound (excluding price support payments) for a crop value of 19.3 million, up slightly from \$17.5 million in 1970.

Large Soybean Crop Despite Weather

Hurricane Ginger and heavy rains caused a significant reduction in yields and quality of soybeans in 1971. The Coastal Plains were hardest hit but yields were well below early season expectations in all areas of the State. Harvest was slowed by wet fields and lagged normal progress by several weeks.

Despite the adverse weather, Tar Heel growers produced 22.5 million bushels of beans for the fourth largest crop of record. The State's yield averaged 24 bushels per acre -- the same as in 1970 but well below the 1969 record of 26.5 bushels. Some 936,000 acres were harvested for beans -- 8 percent above the previous season. Prices averaged \$2.85 per bushel, 5 cents below 1970. The crop was valued at \$64 million.

Peanuts Damaged Severely

Tar Heel peanut production in 1971 was 27 percent below the record 1970 crop and the smallest in a decade. Persistent rains during October caused extensive yield and quality losses. Some acreage was a complete loss. Growers produced about 326 million pounds of nuts on 155,000 acres for an average yield of 2,100 pounds. The yield was well below the 2,670 pound record set in 1970 and the smallest since 1964. Price per pound was a record 14 cents. Farm value was nearly \$46 million but \$13 million below the 1970 record.

Corn Production Up 24 Percent

Tar Heel growers produced nearly 87 million bushels of corn in 1971 -- 24 percent above the short 1970 crop. Growers realized a yield of 57 bushels per acre, 7 bushels above 1970 but 19 bushels below the 1967 record. Hurricane Ginger and an excessively wet fall reduced yields substantially from expectations early in the season. Harvest was practically at a standstill during October and early November. Unharvested corn deteriorated rapidly in most Coastal counties where stalks were down and harvesting losses were heavy. The 1.5 million acres harvested for grain was the largest since 1960. Growers received an average of \$1.14 per bushel, well below the \$1.55 the previous season.

Record Small Grain Yields

Wheat production in 1971 was 11.6 million bushels -- shattering the 1961 record and 36 percent larger than the 1970 crop. Farmers harvested an average of 43 bushels per acre equaling the 1970 record yield. Prices averaged \$1.46 per bushel, 13 cents above a year earlier. 1971 production was worth nearly \$17.0 million -- up 5.6 million from 1970. Acreage for grain is estimated at 270,000 -- 36 percent above 1970.

Oat production totaled 7.4 million bushels -- 1.0 million above 1970. Yield per acre was 56 bushels, topping the 1970 record by 4 bushels. The acreage harvested for grain totaled 133,000, up from 124,000 a year earlier. Average price per bushel was 72 cents -- 1 cent below the previous season.

Commercial Vegetable Acreage Down -- Value Up

Commercial vegetable acreage for fresh market and processing is estimated at about 75,660 acres for 1971, down 640 acres from 1970. Total fresh market harvest was 46,050 compared with 45,910 acres in 1970. Acreage of vegetables for processing is estimated at 29,610 for 1971 and 30,390 acres for 1970.

The value of vegetables harvested for fresh market and processing in the Tar Heel State totaled \$29.7 million in 1971 compared with \$25.7 million in 1970. Commercial fresh market vegetables were valued at \$21.3 million while processing vegetables were worth \$8.4 million.

Apple Production 17 Percent Lower

The 1971 commercial crop (sold and utilized) is estimated at 185 million pounds, 17 percent below the 1970 record of 223 million pounds. Economic loss was estimated at 5 million pounds, well below the 11 million from the 1970 crop. Total production of 190 million pounds in 1971 was 44 million pounds below 1970. The 1971 value of production was \$8.0 million.

1971 MONTHLY WEATHER-CROP SUMMARY
BY ALBERT V. HARDY, CLIMATOLOGIST FOR NORTH CAROLINA
NOAA, National Weather Service

GENERAL: Average rainfall over North Carolina was the greatest since 1964, and the second greatest in the past twenty years. The distribution of precipitation over the year was generally favorable, with very few long periods of dry weather. Wet weather became a negative factor when Hurricane Ginger ushered in a record-breaking wet October, causing much loss of farm crops due to sprouting, rotting, and harvest problems.

Temperatures averaged below normal for the first five months, and also in July, August, and November. June and September were near normal; October and December were warm, December the warmest in several years. On the average, the year was warmer than most years since 1958, but cooler than the earlier '50s and the '40s. There were very few extremes of unusually hot or cold weather in 1971.

High yields and good quality were generally realized in spring-harvested crops, as well as for most summer crops harvested before Hurricane Ginger struck at the end of September. That event, followed by the wettest October of record, caused much delay in harvesting the remainder of crops, reducing both quantity and quality.

JANUARY: A mild month compared with the record cold of January 1970, but still averaging about four degrees below normal. In general, high temperatures reached 70 only in the Coastal Plain, and low temperatures reached zero only on the highest Mountain peaks. In central areas freezing occurred on two out of three nights, and the coldest of the month was around 10°F. Snow fell on several days inland and once to the coast, but amounts were not large; most precipitation fell as rain. Total amounts ranged two to eight inches; normal or slightly more except below normal in the northern and western Piedmont and the northern Mountains. Widespread ice storms on the 9th and strong winds toward the end of the month caused some damage to trees and roofs. Farm work in January was mostly confined to repairs and inside chores.

FEBRUARY: Early February was cold, with some zero weather in the Mountains the 2nd and 10th. Late February was warm, remaining above freezing most of the time. It averaged the warmest and the wettest February in five years, but temperatures still averaged below normal and precipitation only a little above normal. Snow was scant except in the northern Mountains and western slopes; rain fell frequently. An ice storm affected most of North Carolina February 3 - 5. It was quite windy around the 13th and 22nd; a destructive tornado struck Fayetteville and areas to the north on the 22nd. Little farm work was possible in early February due to cold, wet weather but much preparatory farming was done the last ten or twelve days.

MARCH: March was moderately cold and often quite windy. Highest temperatures reached 80°F in the warmest places around mid-month; lowest reached 10°F in the higher Mountains and the twenties generally on the 5th and 25th. Rain fell frequently, but in mostly light to moderate amounts. Totals were above normal in the south portion, and near or slightly below normal elsewhere. Snow fell several times in the Mountains, and reached almost all areas the 25th and 26th. Snow and wind together made blizzard-like conditions in the Mountains several days in early March. Farm work was impeded in some areas by wet and cold weather, but frequent sunny periods made two to three days of each week suitable for outdoor work.

APRIL: This month began and ended rather cold, with a range of temperatures from 20°F to 90°F between times; the average temperature was below normal, as the earlier three months of 1971 had been. There was a long dry spell from the 8th through the 20th, and total rainfall for the month was only one-half to three-fourths of normal due to that spell; the rest of the month's rainfall was average, and fairly well distributed. April was often moderately windy, but there was very little stormy weather. Fair weather was predominant, and good progress was made in farm work, but cool nights slowed the growth of spring-planted crops.

MAY: North Carolina averaged colder than normal for the fifth consecutive month. Frost and freezing temperatures affected the Mountains and the north portions of the other areas the morning of the 4th. Highest temperatures reached around 90°F on the 20th. Precipitation was above normal in all general areas, but was heaviest in the previously dry northern portion. Some minor flooding of river low-grounds occurred. There were thunderstorms on several days, with some local damage due to hail and lightning. The first half of the month was rather windy, with damage in several localities the 13th. Crop growth was generally a little late due to much cool weather.

JUNE: Temperatures averaged near normal in June, for the first time in 1971. The range was from the middle fifties to the middle nineties, except cooler in the Mountains. The first eight days were quite dry in most areas; thereafter rain fell frequently enough, but amounts were very small in north-central North Carolina, so that some weather stations had less than an inch total for the month. Else-

where totals were mostly a little below normal, but a few areas had above normal rainfall. Winds were rather quiet over most of the State, but the inevitable summer thunderstorms caused some damaging winds, hail and lightning over limited areas. Most crops made good progress in the moderate June weather, but tobacco remained a little behind the season in growth and development.

JULY: The month was rather humid, with much cloudiness and morning fog; frequent thundershowers caused hail, lightning or locally damaging winds somewhere in the State every few days. Temperatures averaged below normal, but slightly higher than those of the previous July; there were no unusually high or low temperatures at any time. Rainfall was erratic, and there were dry areas and wet areas within the State most of the month; average precipitation was above normal except in the north portions of the Piedmont and Coastal Plain. A dry period around mid-month ranged from one to two weeks long in the various areas. It was a good month for plant growth, and most crops made good progress.

AUGUST: Two tropical storms and other offshore weather caused much cloudiness and rain in eastern North Carolina. Other areas were drier, with precipitation generally below normal in the Mountains and northern Piedmont. Temperatures again averaged below normal in all areas, and reached 90°F only half as frequently as in warm Augusts. There were fewer thunderstorms and less hail than is usual for August, and sunny weather was plentiful except near the coast. Outside the Mountains a dry period of five or more days began on the 6th; in the southern Mountains the final eight days were dry. Most crops continued to grow well, and prospects at the end of August were for a good crop year.

SEPTEMBER: Temperatures averaged a little above normal in the Mountains, and near normal in other areas. Eighty degree readings occurred frequently at mid-afternoon until the end of the month; ninety degrees occurred occasionally in the warmer areas through the 21st. Low temperatures were rarely below 50°F except in the Mountains. Precipitation was generally scant until around the 8th to 10th, when a brief wet spell set in; another wet spell beginning on the 17th affected the Mountains and parts of the Piedmont. It was rather dry after the 24th, except that Hurricane Ginger arrived at the end of the month and caused torrential rains near the coast on the final two days. Crop prospects continued good until Ginger. Crops harvested before Ginger included about 40 percent of the total corn acreage, 30 percent of peanuts, and 80 percent of hay.

OCTOBER: This was the rainiest October in North Carolina history, and the rainiest for any calendar month since July 1959. It was also one of the warmest, cloudiest, and most humid Octobers of record. Daily high temperatures reached the seventies and low eighties until the end of the month; lowest readings of the month were generally in the forties except in the Mountains. Soils saturated by Hurricane Ginger remained wet all month; water standing in fields was commonplace in parts of the Coastal Plain, especially the Peanut Belt. Heaviest percentage damage was to peanuts; some poorly drained fields had to be abandoned. There were also serious losses in quantity and quality of corn, cotton and soybeans; most of the flue-cured tobacco had already been harvested.

NOVEMBER: Typical November weather prevailed; mostly fair, with scant precipitation except in the southern Mountains. There was rain the first few days, then very little until the 24th; frequent light rains fell thereafter. Days were mild, but nights frequently cold; freezing occurred several times, beginning around the 4th. Highest temperatures were about 80°F on or near the 2nd, lowest near 20°F on or about the 23rd. Good harvest conditions began about the 5th in well-drained areas, and the 10th in poorly drained soils. Harvesting and small grain seeding were delayed due to wet soils in October and early November, and were incomplete at the end of the month.

DECEMBER: The warmest December in fifteen years, averaging eight degrees above normal; it was slightly warmer than November in most areas. There was much cloudy weather, with precipitation every few days; most amounts were light, however, and December totals only about half of normal over the Coastal Plain and eastern Piedmont. Only the southern Mountains had precipitation significantly above normal; total amounts there ranged up to twelve inches. The only significant snow and sleet came early in the month; some fell in nearly all areas the 3rd, continuing for the next few days in the Mountains. It accumulated up to 18 inches in the southern Mountains, but melted in warm rains the 6th and 7th, causing some flooding. The longest dry period came at Christmas, spanning a three-day period on either side of the Holiday. Delayed harvesting of corn, cotton and soybeans, and seeding of small grains continued in December as weather and soil conditions permitted.

1/ The season average estimates used in this report to evaluate production are estimates of the average price received by producers for that part of the crop that is sold. 2/ Values are for the crop year and should not be confused with calendar year income. 3/ Estimates include grazing and hogging. 4/ Production in 480-lb. net wt. bales. 5/ Includes all kinds except alfalfa hay. 6/ Green-weight. 7/ Not available. 8/ 1970 price used in evaluating 1971 value.

* 1971 preliminary.

1/ 480 pound net weight bales. 2/ Includes all kinds of hays except alfalfa. * Too small to estimate.

NOTE: In some cases the acreage or yield or production is identical for more than one year. In such cases the year shown is the latest year of occurrence.

LIVESTOCK -- REVIEW OF 1971 SEASON

Cash Receipts Drop

Preliminary estimates of cash receipts from sales of livestock and livestock products by North Carolina producers during 1971 amount to \$603 million -- a decrease of 3 percent from the \$625 million received in 1970. Cash receipts from broilers accounted for 24 percent of total livestock cash receipts; pork production accounted for 19 percent; egg production, 19 percent; and dairy products, 17 percent. All other products combined accounted for the remaining 21 percent.

Hog Numbers Turn Down

There were 1,950,000 hogs and pigs on N. C. farms on December 1, 1971. Numbers decreased 4 percent from the 2,031,000 head on farms December 1, 1970. Hogs increased steadily each year from 1965 through 1970. The 1971 number represented the first decrease in December inventory since 1965. The pig crop during 1971 totaled 3,478,000, a decrease of 1 percent from the record high of 3,496,000 pigs saved in 1970 but 80 percent more than the 1,929,000 pigs saved ten years ago. Sows that farrowed during the December 1, 1970 to November 30, 1971 period totaled 470,000 and averaged 7.4 pigs saved per litter.

Cash receipts from 1971 hog marketings totaled \$115 million. This was 11 percent less than the receipts of \$130 million received from marketings during 1970, but over twice the amount received ten years ago. Price per 100 pounds averaged \$17.20 in 1971, a sharp decline from 1970's average price of \$22.40.

More Cattle and Calves

Cattle and calves on N. C. farms on January 1, 1972 totaled about 1,103,000 head, 2 percent more than the 1,081,000 a year earlier, and 20 percent more than ten years ago.

The January 1, 1972 inventory of beef cows and heifers that had calved, at 381,000, increased 4 percent from the 367,000 head on hand January 1, 1971. A decline of 3,000 milk cows reduced the total number of milk cows to 182,000, or 32 percent of the total cows and heifers that had calved. Beef stock has continued to increase each year as a larger percentage of farm herds is devoted to beef production, leaving a smaller number for milk production. The total cows and calves that had calved (beef and dairy) totaled 563,000 -- an increase of 2 percent from the 1970 level.

Estimated calves born during 1971 numbered 502,000 -- a record for the State. Calves born have increased steadily since 1963.

Gross income from cattle and calves in 1971, at \$66.9 million, (\$62.0 million cash receipts plus \$4.9 million value of home consumption) was 87 percent more than the 1961 gross income. The average price per hundredweight for cattle sold during 1971 was \$24.30 compared with \$23.30 in 1970 and \$16.70 ten years ago. The average price for calves sold during 1971 was \$35.90 per hundredweight compared with \$35.20 during 1970 and \$24.60 ten years ago.

Little Change In Milk Production

The average number of cows milked each month during 1971 in N. C. was 184,000, a decline of 3,000 from 1970. The average number milked during 1961 was 259,000 -- about 41 percent more than in 1971. Better management resulted in more milk production per cow. Milk produced per cow in 1971 averaged 8,342 pounds compared with only 5,980 pounds in 1961. Thus, total milk production amounted to 1,535 million pounds in 1971, only 14 million pounds less than the total produced in 1961. Milk production in 1970 totaled 1,505 million pounds.

In 1971, about 90 percent of the milk produced was marketed, and cash receipts totaled \$101 million. These receipts were 54 percent more than returns 10 years ago.

Third Largest Turkey State

Turkeys raised on N. C. farms during 1971 totaled 10,469,000, 9 percent more than the 9,579,000 raised in 1970, almost 3 times the number raised 10 years ago, and over 13 times the birds raised 20 years ago. The average price received per pound of turkey produced in 1971 was 22.8 cents, an advance of 1.1 cent from 1970. Gross income from turkeys during 1971, at \$41.8 million, was 9 percent more than the year before and 3½ times the income of ten years ago. Estimated turkey breeder hens on hand December 1, 1971 totaled 270,000, a slight decline from the 277,000 on hand a year earlier. The State placed third in the Nation in turkey production during 1971.

Broiler Production Declines

Commercial broiler production during 1971 totaled 289,926,000 birds but dropped 6 percent from the 308,624,000 produced in 1970. Production has increased about 50 percent during the past decade.

The price received per bird in 1971 advanced slightly due to a heavier bird being marketed, but the price per pound declined slightly. Gross income from broilers produced declined in 1971 to \$148 million, or 6 percent from income the previous year. N. C. broiler production is the fourth largest in the Nation.

Less Eggs

Egg production in the State during 1971 totaled nearly 3.6 billion, down only 76 million from 1970's record production. Eggs consumed on farms where produced totaled 69 million, a record low. This compared with 72 million in 1970 and 193 million in 1961. The average price per dozen dropped to 39.1 cents during 1971, about a nickel less than the average price received during 1970. This, together with a slightly smaller annual production, resulted in a lower gross income of \$117 million. Tar Heel egg production in 1971 ranked fourth in the U. S.

Chickens raised in 1971 (excluding commercial broilers) totaled 18,285,000 birds, up 15 percent from the 15,900,000 raised in 1970. The 14,312,000 birds sold during 1971 was 20 percent more than the number sold the previous year and over twice the total sold ten years ago. Chickens consumed on farms was slightly higher than 1970. In 1970 the smallest number was consumed since records began in 1924. Gross income from chickens, excluding commercial broilers, during 1971 amounted to \$10.6 million, up \$1.1 million from 1970.

^{1/} Includes bulbs, plants and trees. ^{2/} Repairs and maintenance of buildings, motor vehicles and other machinery, and petroleum fuel and oil used in the farm business. ^{3/} Includes interest on non-real-estate debt, pesticides, ginning, electricity and telephones, livestock marketing charges, containers, milk hauling, irrigation, grazing, binding materials, tolls for sirup, horses and mules, harness and saddlery, blacksmithing and hardware, veterinary services and medicines, net insurance premiums (crop, fire, wind and hail) and miscellaneous dairy, nursery, greenhouse, apiary and other supplies. ^{4/} Includes cash wages, perquisites and (1951 to date) social security taxes paid by employers. ^{5/} Includes depreciation and accidental damage to farm buildings and depreciation of motor vehicles and other farm machinery and equipment.

AGRICULTURE: How North Carolina Ranks. Among States

1st	in farm population (1960 U. S. Census)
1st	in flue-cured tobacco production
1st	in total tobacco production
1st	in value of home consumption from crops and livestock
1st	in cash receipts from Farm Forestry
1st	in sweet potato production
2nd	in number of farms
3rd	in egg production
3rd	in turkey production
4th	in peanut production
4th	in commercial broiler production
5th	in cash farm income from crops
8th	in apple production
8th	in hog production
10th	in number of hogs on farms
10th	in peach production
12th	in soybean production
13th	in corn production
15th	in sorghum grain production
16th	in oat production
18th	in cash farm income from livestock
18th	in winter wheat production
20th	in Irish potato production
21st	in number of milk cows on farms
23rd	in milk production
35th	in number of all cattle on farms

NOTE: Production figures are for 1971. Income figures are for 1970. Inventory numbers are as of January 1, 1972.

CLIMATOLOGICAL PROBABILITIES OF WEEKLY PRECIPITATION IN NORTH CAROLINA

By ALBERT V. HARDY, CLIMATOLOGIST FOR NORTH CAROLINA
NOAA, National Weather Service

PRECIPITATION NORMALS. Most of the precipitation records in North Carolina (and in the United States) consist of measurements made once a day and summarized by simple addition for monthly totals. Where a sufficient number of years' data have been thus accumulated, monthly 'normals' have been computed by obtaining the arithmetic mean for each calendar month. For example, the sum of all January rainfall amounts for a given station for the thirty year period 1931 - 1960, divided by thirty, has been used during the past decade as the January normal for that station.

ADVANTAGES AND DISADVANTAGES OF THE MEAN. One of the advantages of using the arithmetic mean as 'normal' is that it can be computed simply for any period of time--a day, a week, a month, or a year--and normals so computed for short periods can be added to produce similar normals for a longer period. Up through the early 1950s daily 'normals' of precipitation were actually computed for the principal weather stations, and were smoothed and adjusted to conform to monthly and annual normals in use. The daily normals were used in comparing accumulated actual precipitation through any date of the current month or year with normal or expected precipitation for the same period. While daily normals of precipitation no longer have official status, such comparisons are still sometimes made to meet local demand and need.

The use of the term, 'normal', implies to most readers that this is the amount of rain most likely to occur. Because precipitation amounts are not, in the statistical sense, normally distributed, the arithmetic mean may in actuality be a poor estimate of the most likely amount. The shorter the period of time, the poorer the estimate provided by the mean. For example, in North Carolina, the average or arithmetic mean amount of rain for a single day in a central location is about 0.12 inch. Since rain occurs, on the average, only about every third day, the most likely amount for a single day is zero. For a longer period of time, such as a month, the difference is less obvious, but just as real. We have shown (1) that the mean precipitation for October in the Central Piedmont is about three inches, while the most likely amount (50% probability level) is more nearly two and one-half inches. For a period of as much as a year in North Carolina the most likely amount does not differ much from the mean, but this would not necessarily be true in all climates.

USEFULNESS OF WEEKLY PROBABILITY STATISTICS. Probabilities of a given amount of precipitation at a given time of year may be very useful in the planning of agricultural and other activities to have the best chance of success. To have the greatest usefulness, these probabilities must be made available for shorter periods than the calendar month. In order to plan the most favorable time in spring to plant corn, or the best week in fall to hold an Agricultural Fair, it would be useful to know the precipitation probabilities by weeks.

Some climatic statistics (2) have already been presented by weeks. Since the weeks on the actual calendar change from year to year, a standard 'Climatological Year' beginning March 1 has been adopted, for presentation, study and use of climatic and phenological data. This table was given in (2), but is repeated here for convenience (Table 1).

WEEKLY PRECIPITATION DATA. We have tabulated from the precipitation records for Raleigh for the 84 years 1887-1970 the actual observed amounts of precipitation for each Climatological Week, and have listed the amounts corresponding to specified probabilities in Table 2. For each Climatological Week, listed by number at the left, an amount of precipitation equal to or greater than that shown in the table actually occurred in that percentage of years shown at the top of the column. The percentages listed, then, give the climatological probabilities of the tabulated amounts being equaled or exceeded in any year.

From the tabulated probabilities it can be seen that the period of greatest precipitation probability at Raleigh centers around Climatological Week No. 20, or the middle week of July. Periods of lowest probable amount--at the 50 percent level--occur at about weeks 7 through 10 in the spring and again about weeks 31 through 35 in the fall. These probabilities are compiled from Raleigh data only, but it is likely that similar characteristics would be found over a large part of central North Carolina.

Some irregularities exist in the results obtained by simple arraying of data, even where a relatively long period of record such as that used for Raleigh is available. It is expected that a distribution of probable amounts that would be smoother and better applicable to future planning could be obtained by a statistical treatment of the data, similar to that developed by Thom and Barger (3) and used by Strommen and Horsfield (4) in preparing the monthly probabilities used in our 1969 report (1). In the future we expect to apply this method to the weekly data for Raleigh, and also to data for other areas of North Carolina.
