Re: Chamber Inspection 05 October 2010

In this inspection, the chamber was found to be operating as designed, providing 8.8% CO to the chamber in 22 seconds at 20 psi. CO readings, done with a calibrated MSA MiniCO Meter, revealed no leaks in any of the seals, view ports, or regulator. A small leak was detected in the packing gland on the CO supply valve. After tightening, the valve showed no leakage. The CO level in the area around the chamber remained at the background level, a level safe to personnel.

The stack velocity, as measured with a calibrated Mannix DAF800 Digital Anemometer, was 3062 FPM. The exhaust fan is warranted by the manufacturer to be explosion proof.

At this time, this chamber is operating as designed, and is safe to operate.
